GDML and CAD Interfaces

- Up to now, the course has shown how to define materials and volumes from C++.
- This part of slides shows some alternate ways to define geometry at runtime by providing a file-based detector description.

Silicon Pixel & Microstrip
Tracker for Collider Detector

GDML : Geometrical Description Modeling Language

- An XML-based language designed as an application independent persistent format for describing the geometries of detectors.
 - Implements “geometry trees” which correspond to the hierarchy of volumes a detector geometry can be composed of
 - Allows materials to be defined and solids to be positioned
- Because it is pure XML, GDML can be used universally
 - Not just for Geant4
 - Can be format for interchanging geometries among different applications.
 - Can be used to translate CAD geometries to Geant4
- XML is simple
 - Rigid set of rules, self-describing data validated against schema
- XML is extensible
 - Easy to add custom features, data types
- XML is Interoperable to OS’s, languages, applications
- XML has hierarchical structure
 - Appropriate for Object-Oriented programming
 - Detector/sub-detector relationships

GDML structure

- Contains numerical values of constants, positions, rotations and scales that will be used later on in the geometry construction.

- Uses CLHEP expressions

- Constants

- `<constant name="length" value="6.25"/>`

- Variables

- `<variable name="x" value="6"/>`

- Once defined, can be used anywhere later, e.g.

- `<variable name="y" value="x/2"/>`

- `<box name="my_box" x="x" y="y" z="x+y"/>`

- Positions

- `<position name="P1" x="25.0" y="50.0" z="75.0" unit="cm"/>`

- Rotations

- `<rotation name="RotateZ" z="30" unit="deg"/>`

- Matrices

- `<matrix name="m" coldim="3" values=" 0.4 9 126`

- `8.5 7 21`

- `34.6 7 9"/>`

GDML structure

- Simple Elements

```
<element Z="8" formula="O" name="Oxygen" >  
  <atom value="16" />  
</element>
```

- Material by number of atoms (“molecule”)

```
<material name="Water" formula="H2O">  
  <D value="1.0" />  
  <composite n="2" ref="Hydrogen" />  
  <composite n="1" ref="Oxygen" />  
</material>
```

- Material as a fractional mixture of elements or materials, (“compound”):

```
<material formula="air" name="Air" >  
  <D value="0.00129" />  
  <fraction n="0.7" ref="Nitrogen" />  
  <fraction n="0.3" ref="Oxygen" />  
</material>
```

Importing GDML file

- GDML files can be directly imported into Geant4 geometry, using the GDML plug-in facility:

```
#include "G4GDMLParser.hh"
```
- Generally you will want to put the following lines into your DetectorConstruction class:

```
G4GDMLParser parser;  
parser.Read("geometryFile.gdml");  
G4VphysicalVolume* W = parser.GetWorldVolume();
```
- To include the Geant4 module for GDML,
 - Install the XercesC parser (version 2.8.0 or 3.0.0)
<http://xerces.apache.org/xerces-c/download.cgi>
 - Set appropriate environment variables when G4 libraries are built
- Examples available in:

```
$G4INSTALL/examples/extended/persistency/gdml
```

Importing CAD geometry

- Users with 3D engineering drawings may want to incorporate these into their Geant4 simulation as directly as possible
- Difficulties include:
 - Proprietary, undocumented or changing CAD formats
 - Usually no connection between geometry and materials
 - Mismatch in level of detail required to machine a part and that required to transport particles in that part
- CAD is never as easy as you might think (if the geometry is complex enough to require CAD in the first place)
- **CADMesh** is a direct CAD model import interface for GEANT4 optionally leveraging VCGLIB, and ASSIMP by default. Currently it supports the import of triangular facet surface meshes defined in formats such as STL and PLY. A G4TessellatedSolid object is returned and can be included in a standard user detector constructor.
 - <https://code.google.com/p/cadmesh/>
- One output format most CAD programs do support is STEP
 - Not a complete solution, in particular does not contain material information
 - There are movements under way to get new formats that contain additional information, but none yet widely adopted.

CADMesh

- **CADMesh** is a direct CAD model import interface for GEANT4 optionally leveraging VCGLIB, and ASSIMP by default. Currently it supports the import of triangular facet surface meshes defined in formats such as STL and PLY. A G4TessellatedSolid is returned and can be included in a standard user detector construction.

Ge **Fig. 3** Six test geometries loaded directly into GEANT4 using the proposed CAD interface and visualised using the GEANT4 OpenGL viewer.

CADMesh

Loading CADMesh solid

- CADMesh provides a G4TessellatedSolid object (a kind of G4VSolid).

```
#include "CADMesh.hh"
G4VPhysicalVolume* MyDetectorConstruction::Construct()
{
  ...
  CADMesh cadMesh;
  G4VSolid* aSolid = cadMesh.LoadMesh( file_name, file_type );
  G4LogicalVolume* aLV = new G4LogicalVolume( aSolid, material, "name" );
  G4VPhysicalVolume* aPV = new G4PVPlacement( 0,
      G4ThreeVector(x,y,z), aLV, "name", motheLV, 0, 0 );
  ...
}
```

Importing CAD geometries: more solutions ...

- InStep: supporting import/export of various formats including STL, STEP and GDML
<https://www.solveering.com/InStep/instep.aspx>
- SALOME: can import STEP BREP/IGES/STEP/ACIS, mesh it, export to STL (then STL2GDML)
<http://www.salome-platform.org>
- ESABASE2: space environment analysis CAD, basic modules are free for academic non-commercial use. Exports to GDML shapes or complete geometry. Imports STEP.
<https://esabase2.net>
- Blender GDML exporter: GDML plug-in for Blender tool
http://projects.blender.org/tracker/index.php?func=detail&aid=30578&group_id=153&atid=467
- FASTRAD: 3D tool for radiation shielding analysis, exports meshes to GDML
<http://www.fastrad.net>
- STEP Solutions: commercial, exports meshes GDML
<http://www.steptools.com/products/stdev/>
- Cogenda TCAD: for the case of 3D meshes. Module Gds2Mesh exports to GDML
<http://www.cogenda.com/article/products#VTCAD>
- SW2GDML: converts SolidWorks descriptions (using its API) to real primitives in GDML, including material
<https://github.com/cvuosalo/SW2GDMLconverter>
- CadMC: tool to convert FreeCAD geometry to Geant4 (tessellated and CGS shapes)
<http://polar.psi.ch/cadmc/>
- McCAD tool: 'integrated approach' by KIT group using half-space solids extensions to Geant4

Debugging geometries

- An **protruding** volume is a contained daughter volume which actually **protrudes** from its mother volume.
- Volumes are also often positioned in a same volume with the intent of not provoking intersections between themselves. When volumes in a common mother actually **intersect themselves** are defined as **overlapping**.
- Geant4 **does not allow** for malformed geometries, **neither protruding nor overlapping**.
 - The behavior of navigation is unpredictable for such cases.
- The problem of detecting overlaps between volumes is bounded by the complexity of the solid models description.
- Utilities are provided for detecting wrong positioning
 - Optional checks at construction
 - Kernel run-time commands
 - Graphical tools (DAVID, OLAP)

Optional checks at construction

- Constructors of **G4PVPlacement** and **G4PVParameterised** have an optional argument “pSurfChk”.

```
G4PVPlacement(G4RotationMatrix* pRot,  
              const G4ThreeVector &tlate,  
              G4LogicalVolume *pDaughterLogical,  
              const G4String &pName,  
              G4LogicalVolume *pMotherLogical,  
              G4bool pMany, G4int pCopyNo,  
              G4bool pSurfChk=false);
```

- If this flag is true, overlap check is done at the construction.
 - Some number of points are randomly sampled on the surface of creating volume.
 - Each of these points are examined
 - If it is outside of the mother volume, or
 - If it is inside of already existing other volumes in the same mother volume.
- This check requires lots of CPU time, but it is worth to try at least once when you implement your geometry of some complexity.

Debugging run-time commands

- Built-in run-time commands to activate verification tests for the user geometry are defined
 - to start verification of geometry for overlapping regions based on a standard grid setup, limited to the first depth level
`geometry/test/run` or `geometry/test/grid_test`
 - applies the grid test to all depth levels (may require lots of CPU time!)
`geometry/test/recursive_test`
 - shoots lines according to a cylindrical pattern
`geometry/test/cylinder_test`
 - to shoot a line along a specified direction and position
`geometry/test/line_test`
 - to specify position for the `line_test`
`geometry/test/position`
 - to specify direction for the `line_test`
`geometry/test/direction`

Debugging run-time commands

- Example layout:

```
GeomTest: no daughter volume extending outside mother detected.
```

```
GeomTest Error: Overlapping daughter volumes
```

```
    The volumes Tracker[0] and Overlap[0],
```

```
    both daughters of volume World[0],
```

```
    appear to overlap at the following points in global coordinates: (list truncated)
```

```
length (cm)      ----- start position (cm) -----      ----- end position (cm) -----
    240           -240           -145.5           -145.5           0           -145.5           -145.5
```

```
Which in the mother coordinate system are:
```

```
length (cm)      ----- start position (cm) -----      ----- end position (cm) -----
. . .
```

```
Which in the coordinate system of Tracker[0] are:
```

```
length (cm)      ----- start position (cm) -----      ----- end position (cm) -----
. . .
```

```
Which in the coordinate system of Overlap[0] are:
```

```
length (cm)      ----- start position (cm) -----      ----- end position (cm) -----
. . .
```

Debugging tools: DAVID

- **DAVID** is a graphical debugging tool for detecting potential intersections of volumes
- Accuracy of the graphical representation can be tuned to the exact geometrical description
 - physical-volume surfaces are automatically decomposed into 3D polygons
 - intersections of the generated polygons are parsed.
 - If a polygon intersects with another one, the physical volumes associated to these polygons are highlighted in color (**red** is the default).
- DAVID can be downloaded from the Web as external tool for Geant4
 - <http://geant4.kek.jp/~tanaka/>

Smart voxelization

- In Geant4, user's geometry is automatically optimized to be most suitable to the navigation. - "Voxelization"
 - For each mother volume, one-dimensional virtual division is performed.
 - Subdivisions (slices) containing same volumes are gathered into one.
 - Additional division again using second and/or third Cartesian axes, if needed.
- "*Smart voxels*" are computed at initialisation time
 - When the detector geometry is *closed*
 - Does not require large memory or computing resources
 - At tracking time, searching is done in a hierarchy of virtual divisions

Geometry IV

Detector description tuning

- Some geometry topologies may require ‘special’ tuning for ideal and efficient optimisation
 - for example: a dense nucleus of volumes included in very large mother volume
- Granularity of voxelization can be explicitly set
 - Methods `SetSmartless()` from `G4LogicalVolume`
- Critical regions for optimisation can be detected
 - Helper class `G4SmartVoxelStat` for monitoring time spent in detector geometry optimisation
 - Automatically activated if `/run/verbose` greater than 1

Percent	Memory	Heads	Nodes	Pointers	Total CPU	Volume
91.70	1k	1	50	50	0.00	Calorimeter
8.30	0k	1	3	4	0.00	Layer

Visualising voxel structure

- The computed voxel structure can be visualized with the final detector geometry
 - Helper class `G4DrawVoxels`
 - Visualize voxels given a logical volume

```
G4DrawVoxels::DrawVoxels(const G4LogicalVolume*)
```

- Allows setting of visualization attributes for voxels

```
G4DrawVoxels::SetVoxelsVisAttributes(...)
```

- useful for debugging purposes

Contents

- GDML/CAD interfaces
- Geometry checking tools
- Geometry optimization
- Parallel geometry

Parallel navigation

- Occasionally, it is not straightforward to define sensitivity, importance or envelope to be assigned to volumes in the mass geometry.
 - Typically, a geometry that is built machinery by CAD, GDML, DICOM, etc. has this difficulty.
- Parallel navigation functionality allows the user to define more than one worlds simultaneously.
 - **G4CoupledTransportation** process sees all worlds simultaneously.
 - A step is limited not only by the boundary of the mass geometry but also by the boundaries of parallel geometries.
 - Materials, production thresholds and EM field are used only from the mass geometry.
 - Exception for materials in “layered mass geometry”
 - In a parallel world, the user can define volumes in arbitrary manner with sensitivity, regions with shower parameterization, and/or importance field for biasing.
 - **Volumes in different worlds may overlap.**

Parallel navigation

- **G4VUserParallelWorld** is the base class where the user implements a parallel world.
 - The world physical volume of the parallel world is provided by G4RunManager as a clone of the mass geometry.
 - All UserParallelWorlds must be registered to UserDetectorConstruction.
 - Each parallel world has its dedicated G4Navigator object, that is automatically assigned when it is constructed.
- Though all worlds will be comprehensively taken care by G4CoupledTransportation process for their navigations, each parallel world must have its own process to achieve its purpose.
 - For example, in case the user defines a sensitive detector to a parallel world, a process dedicated to this world is responsible to invoke this detector. G4SteppingManager sees only the detectors in the mass geometry. The user has to have **G4ParallelWorldProcess** in his physics list.

example/extended/runAndEvent/RE06

- Mass geometry
 - sandwich of rectangular absorbers and scintillators
- Parallel scoring geometry
 - Cylindrical layers

Layered mass geometries in parallel world

- Suppose you implement a wooden brick floating on the water.

- Dig a hole in water by a Boolean operation...

- Or, chop a brick into two and place them separately...

Layered mass geometries in parallel worlds

- Parallel geometry may be stacked on top of mass geometry or other parallel world geometry, allowing a user to **define more than one worlds with materials** (and region/cuts).
 - Track will see the material of top-layer, if it is null, then one layer beneath.
 - Alternative way of implementing a complicated geometry
 - Rapid prototyping
 - Safer, more flexible and powerful extension of the concept of “many” in Geant3

Mass world

Parallel world

Layered mass geometries in parallel worlds - continued

- A parallel world may be associated only to some limited types of particles.
 - May define geometries of different levels of detail for different particle types
 - Example for sampling calorimeter: the mass world defines only the crude geometry with averaged material, while a parallel world with all the detailed geometry. Real materials in detailed parallel world geometry are associated with all particle types except e^+ , e^- and gamma.
 - e^+ , e^- and gamma do not see volume boundaries defined in the parallel world, i.e. their steps won't be limited
 - Shower parameterization such as GFLASH may have its own geometry

Geometry seen by e^+ , e^- , γ

Geometry seen by other particles

A medical use case

- Brachytherapy treatment for prostate cancer.

A medical use case

- Instead, seeds could be implemented in an empty parallel world.
 - Seeds in the parallel world would be encapsulated in empty boxes for faster navigation

Another important use case in medicine

- DICOM data contain void air region outside of the patient, while the treatment head should be placed as close as patient's body.

Another important use case in medicine

- Implement the treatment head in a parallel world.

Another important use case in medicine

- And overlay.

Defining a parallel world with layered mass geometry

main() (RE04.cc)

```
G4String paraWorldName = "ParallelWorld";
G4VUserDetectorConstruction* realWorld = new
    RE04DetectorConstruction;
G4VUserParallelWorldConstruction* parallelWorld
    = new RE04ParallelWorldConstruction(paraWorldName);
realWorld->RegisterParallelWorld(parallelWorld);
runManager->SetUserInitialization(realWorld);
//
G4VModularPhysicsList* physicsList = new FTFP_BERT;
physicsList->RegisterPhysics
    (new G4ParallelWorldPhysics(paraWorldName, true));
runManager->SetUserInitialization(physicsList);
```

Switch of layered
mass geometry

- The name defined in the **G4VUserParallelWorld constructor** is used as the physical volume name of the parallel world, and must be given to G4ParallelWorldPhysics.

Defining a parallel world

```
void RE04ParallelWorldConstruction::Construct()
{
    // World
    G4VPhysicalVolume* ghostWorld = GetWorld();
    G4LogicalVolume* worldLogical = ghostWorld->GetLogicalVolume();
    // material defined in the mass world
    G4Material* water = G4Material::GetMaterial("G4_WATER");
    // parallel world placement box
    G4VSolid* paraBox = new G4Box("paraBox",5.0*cm,30.0*cm,5.0*cm);
    G4LogicalVolume* paraBoxLogical
        = new G4LogicalVolume(paraBox, water, "paraBox");
    new G4PVPlacement(0,G4ThreeVector(-25.0*cm,0.,0.),paraBoxLogical,
        "paraBox",worldLogical,false,0);
}
```

- The world physical volume of the parallel is provided as a clone of the world volume of the mass geometry. The user cannot create it.
- You can fill contents regardless of the volumes in the mass geometry.
- Logical volumes in a parallel world that do not overlay materials should have **null** material pointer.
