INTRODUCTION

Sub-eV active neutrino mass

Seesaw mechanism

$\Delta L = 2$ processes & 0-nu-Beta-Beta

(sub-eV active) neutrinos have mass

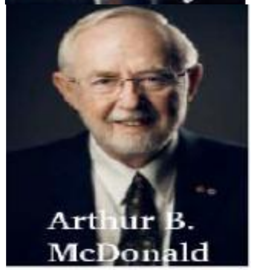
- Neutrinos are massless in SM, $m_\nu = 0$.
  All neutrinos are only left-handed (ν_L).

  $$\mathscr{L}^D_{\text{mass}} = -m_\nu \left(\overline{\nu_R}\nu_L + \overline{\nu_L}\nu_R\right), \qquad m_\nu = \frac{Y_\nu \, \text{v}}{\sqrt{2}},$$

  where Y_ν = Higgs-neutrino Yukawa coupling constant,
  and v = Higgs VEV.
  No way to generate mass without right-handed neutrinos (ν_R).

- But observations of neutrino oscillation imply that **neutrinos have mass**, $m_\nu \neq 0$.

  The Nobel Prize in Physics 2015 was awarded jointly to Takaaki Kajita (Super-Kamiokande) and Arthur B. McDonald (Sudbury Neutrino Observatory) “for the discovery of neutrino oscillations, which shows that neutrinos have mass”.



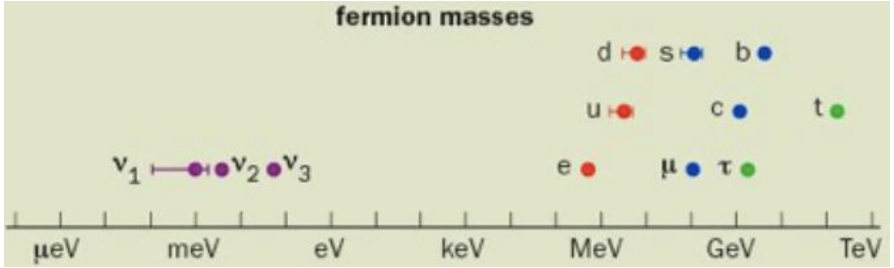
How to give neutrinos mass?

There are various suggestions as to how neutrinos can get mass.

- **Dirac mass:**
  - *Assumption:* ν_R exists.
  - *Lagrangian:*

$$\mathscr{L}^D_{\text{mass}} = -m^D_\nu \left(\overline{\nu_R}\nu_L + \overline{\nu_L}\nu_R\right).$$

  - *Disadvantage:* No reason for m^D_ν to be small.



- **Majorana mass:**
  - *Assumption:* neutrino $\equiv$ anti-neutrino.
  - *Lagrangian:*

$$\mathscr{L}^M_{\text{mass}} = \frac{1}{2} m^M_\nu \left(\overline{\nu^C_L}\nu_L + \overline{\nu_L}\nu^C_L\right).$$

  - *Disadvantage:* $\mathscr{L}^M_{\text{mass}}$ is not invariant under $SU(2)_L \times U(1)_Y$ gauge group, so not allowed by SM.

How to give neutrinos (very small) mass ?

- **See-saw mechanism:** A simpler version of Dirac-Majorana mass, with a nice twist.

[PM,PLB67(1977)421]

  - *Assumptions:* $m_\nu^L = 0$ and $m_\nu^D \ll m_\nu^R$.
  - *Lagrangian:*

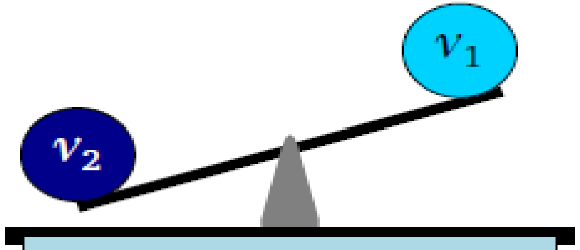
    $\mathscr{L}_{\text{mass}}^{D+M} = \frac{1}{2} m_\nu^R \left(\overline{\nu_R^C} \nu_R \right) - m_\nu^D \left(\overline{\nu_R} \nu_L \right) + \text{H.c.} = \frac{1}{2} \overline{N_L^C} M N_L + \text{H.c.}$, where

    $N_L = \begin{pmatrix} \nu_L \\ \nu_R^C \end{pmatrix}$ and $M = \begin{pmatrix} 0 & m_\nu^D \\ m_\nu^D & m_\nu^R \end{pmatrix}$ is the mass matrix.
  - *Mass eigenvalues:*

$$m_{2,1} = \frac{1}{2} \left(m_\nu^R \pm \sqrt{\left(m_\nu^R\right)^2 + 4 \left(m_\nu^D\right)^2} \right)$$

$$\approx \frac{1}{2} m_\nu^R \left(1 \pm 1 \pm 2 \left(\frac{m_\nu^D}{m_\nu^R} \right)^2 \right).$$

$$\Longrightarrow m_1 \approx -\frac{\left(m_\nu^D\right)^2}{m_\nu^R} \text{ and } m_2 \approx m_\nu^R. \qquad \sin\theta \approx m_\nu^D / m_\nu^R$$



As ν_2 gets heavier, ν_1 become lighter.

  - *Advantage:* $m_1 \ll m_2$, so light neutrinos are possible.
  - *Challenges:*
    - To find the heavy ν_2 experimentally.
    - To prove that both the light ν_1 and heavy ν_2 are Majorana neutrinos.

$$\left[T^{0\nu}_{1/2}\right]^{-1} = G_{0\nu}\ |M_{0\nu}|\ |m_{\beta\beta}|^2$$

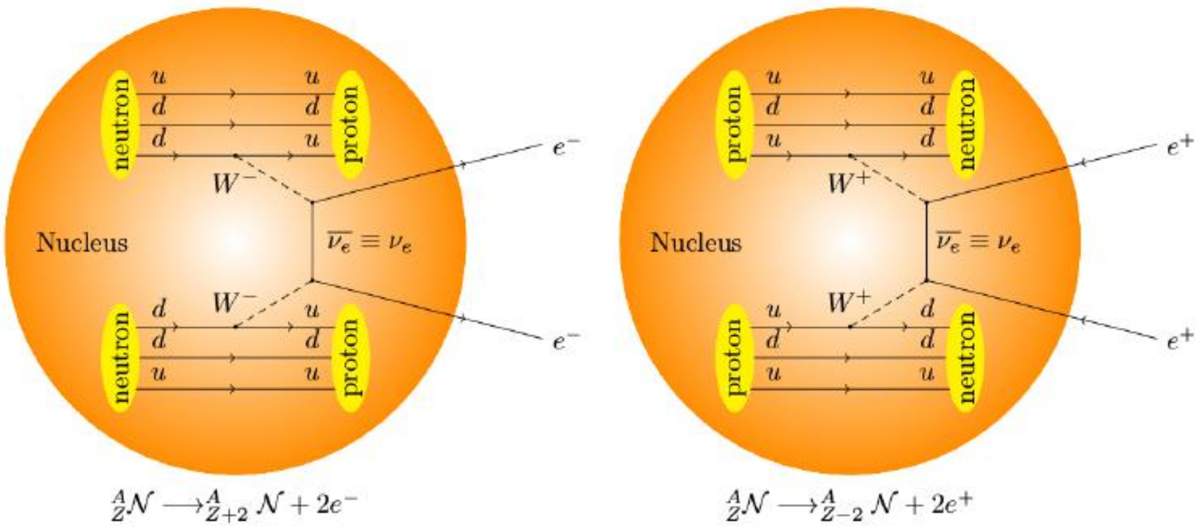
Neutrino-less double-beta decay $(0\nu\beta\beta)$ (4)

Is $0\nu\beta\beta$ the evidence for (sub-eV) active neutrino being Majorana fermion ?

➔ Evidence of Lepton Number Violation

➔ NOT unequivocal evidence of active (sub-eV) neutrino being Majorana neutrino !!

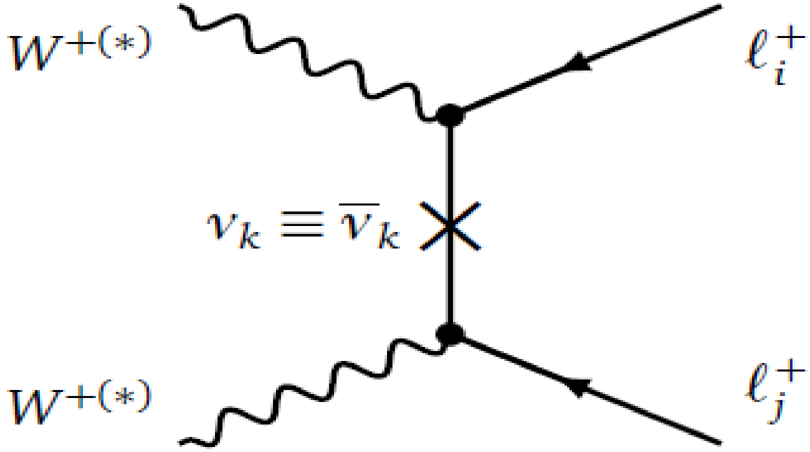
- Process:



e.g. heavy sterile neutrinos can give the same effects

Looking for Majorana neutrinos via $\Delta L = 2$ processes (1)

- Neutrinos are the only *elementary fermions* known to us that *can* have Majorana nature.
- Majorana neutrinos: $\nu \equiv \overline{\nu}$.
- Majorana neutrinos violate lepton flavor number (L), they mediate $\Delta L = 2$ processes.



$$\propto \int \frac{d^4p}{(2\pi)^4} \sum_k U_{\ell_i k}\, U_{\ell_j k}\, \frac{m_k + \not{p}}{p^2 - m_k^2}$$

- $\Delta L = 2$ processes play crucial rule to probe Majorana nature of ν's.
  - $m_k^2 \ll p^2$ — neutrinoless double-beta ($0\nu\beta\beta$) decay
  - $m_k^2 \approx p^2$ — Rare meson decays with $\Delta L = 2$
  - $m_k^2 \gg p^2$ — Collider searches at LHC

Looking for Majorana neutrinos via $\Delta L = 2$ processes (2)

- **Decay rate of any $\Delta L = 2$ process with final leptons $\ell_1^+ \ell_2^+$:**

$$\Gamma_{\Delta L=2} \propto \left| \sum_k U_{\ell_1 k} U_{\ell_2 k} \frac{m_k}{p^2 - m_k^2 + i m_k \Gamma_k} \right|^2 ,$$

where we have used the fact that $(1-\gamma^5)\,\not{p}(1-\gamma^5) = 0$.

- Light ν:

$m_k^2 << p^2$

$$\Gamma_{\Delta L=2} \propto \left| \sum_k U_{\ell_1 k} U_{\ell_2 k} m_k \right|^2 = |m_{\ell_1 \ell_2}|^2 .$$

$|m_{\beta\beta}|^2 \sim (0.01\mathrm{eV})^2 = (10^{-22})\mathrm{GeV}^2$

- Heavy ν:

$m_k^2 >> p^2$

$$\Gamma_{\Delta L=2} \propto \left| \sum_k \frac{U_{\ell_1 k} U_{\ell_2 k}}{m_k} \right|^2 .$$

$m_\nu^R \sim 10^5\,\mathrm{GeV}$ $\quad U \approx \dfrac{m_\nu^D}{m_\nu^R} \sim 10^{-3}$

- Resonant ν:

$m_k^2 \approx p^2$

$$\Gamma_{\Delta L=2} \propto \frac{\Gamma(N \to i)\,\Gamma(N \to f)}{m_N \Gamma_N} .$$

$B^+ \to K^- \mu^+ \mu^+, \ldots$

practical Dirac-Majorana Confusion Theorem

practical Dirac-Majorana Confusion Theorem (pDMCT)

Discussions on pDMCT

practical Dirac-Majorana Confusion Theorem

The difference between Dirac and Majorana neutrinos
via any kinematical observable would be practically impossible to determine due to fact that the observable difference between Dirac and Majorana neutrinos is proportional to the tiny neutrino mass.

B. Kayser, PRD26, 1662 (1982)

(hidden/overlooked) Issues :

1. Historically, only SM allowed neutral current interaction mediated processes were analyzed.
2. No way to gain any information regarding individual neutrino antineutrino energies or 3-momenta.
   This invariably leads to integration over neutrino antineutrino related kinematic variables.

No model-independent, process-independent and observable-independent proof of this so-called "theorem".
All processes where it was shown to hold involved full integration over the 4-momenta of missing neutrinos and/or only for Z^(*) → nu nubar case .

History trying to overcome DMCT, but only confirming

practical Dirac-Majorana Confusion Theorem (1)

Consider the SM allowed decay, e.g.

$$B^0(p_B) \to \mu^-(p_-)\,\mu^+(p_+)\,\bar{\nu}_\mu(p_1)\,\nu_\mu(p_2),$$

Amplitude for Dirac case

$$\mathscr{M}^D = \mathscr{M}(p_1, p_2),$$

$$M^D = M[\mu^-(p_{\mu-}, s_{\mu-}), \mu^+(p_{\mu+}, s_{\mu+}), \bar{\nu}(p_{\bar{\nu}}, s_{\bar{\nu}}), \nu(p_\nu, s_\nu)]$$

For Majorana case

$$\mathscr{M}^M = \frac{1}{\sqrt{2}}\left(\mathscr{M}(p_1, p_2) - \mathscr{M}(p_2, p_1)\right).$$

not helicity flip, but momentum exchange

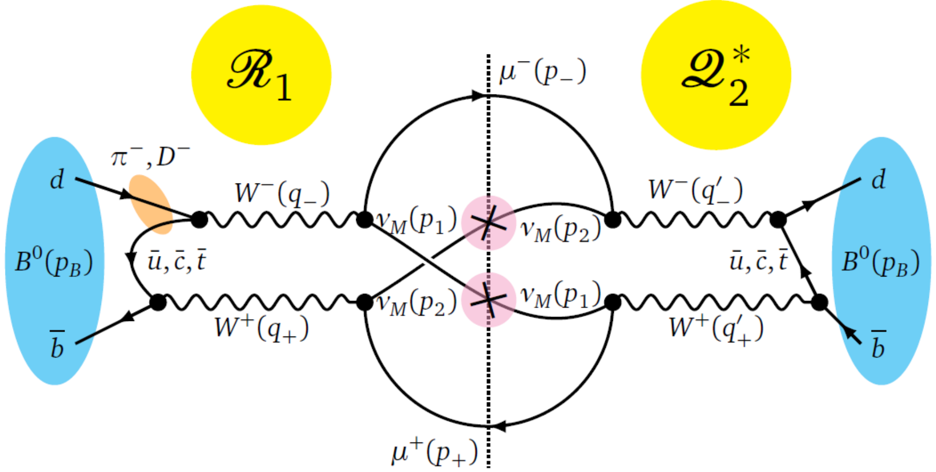
Difference between D and M

$$\left|\mathscr{M}^D\right|^2 - \left|\mathscr{M}^M\right|^2 = \frac{1}{2}\left(\underbrace{|\mathscr{M}(p_1, p_2)|^2}_{\text{Direct term}} - \underbrace{|\mathscr{M}(p_2, p_1)|^2}_{\text{Exchange term}}\right)$$

$$+ \underbrace{\mathrm{Re}\left(\mathscr{M}(p_1, p_2)^* \mathscr{M}(p_2, p_1)\right)}_{\text{Interference term}}.$$

Initial spin averaged, final spin summed

Dirac-Majorana Confusion Theorem (2)



Interference term
(within SM)

$$\mathrm{Re}\left(\mathscr{M}(p_1,p_2)^*\,\mathscr{M}(p_2,p_1)\right) \propto m_\nu^2.$$

In general

$$\underbrace{|\mathscr{M}(p_1,p_2)|^2}_{\text{Direct term}} \neq \underbrace{|\mathscr{M}(p_2,p_1)|^2}_{\text{Exchange term}}.$$

← Possibly only source of D-M difference w/ SM

However, after integration
(required if momenta p_1 and p_2 are unobservable and missing)

$$\iint \underbrace{|\mathscr{M}(p_1,p_2)|^2}_{\text{Direct term}}\, \mathrm{d}^4p_1\, \mathrm{d}^4p_2 = \iint \underbrace{|\mathscr{M}(p_2,p_1)|^2}_{\text{Exchange term}}\, \mathrm{d}^4p_1\, \mathrm{d}^4p_2,$$

Dirac-Majorana Confusion Theorem (2)

Interference term

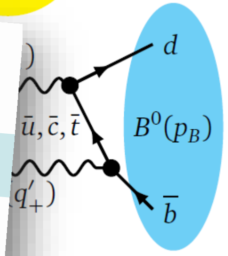
** Special case : $|M(p_1,p_2)|^2 = |M(p_2,p_1)|^2$

$\mathscr{R}_1$ $\mathscr{Q}_2^*$

$\mu^-(p_-)$

$$|\mathcal{M}^D|^2 - |\mathcal{M}^M|^2 = \frac{1}{2}\Big(\underbrace{|\mathcal{M}(p_1,p_2)|^2}_{\text{Direct term}} - \underbrace{|\mathcal{M}(p_2,p_1)|^2}_{\text{Exchange term}}\Big)$$

$$+ \underbrace{\mathrm{Re}\big(\mathcal{M}(p_1,p_2)^* \mathcal{M}(p_2,p_1)\big)}_{\text{Interference term}}. \longrightarrow m_\nu^2$$



<u>In general</u>
(useful if p_1 and/or p_2 are known)

pDMCT holds at the Amplitude-Squared level

➔ Difference between Dirac and Majorana neutrinos becomes 0 at every observable

➔ e.g. Within the SM, weak neutral current decays : $Z^{(*)} \to \nu\bar{\nu}$

nu nubar

3/1/2023 practical Dirac-Majorana Confusion Theorem 32

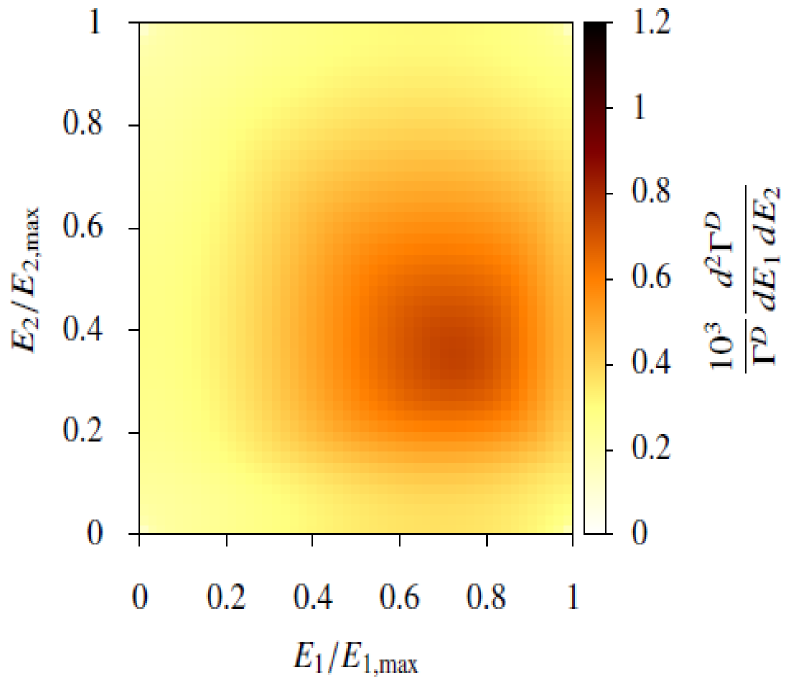
However, after integra
(required if momenta p_1 and p_2 are unobservable)

Direct term

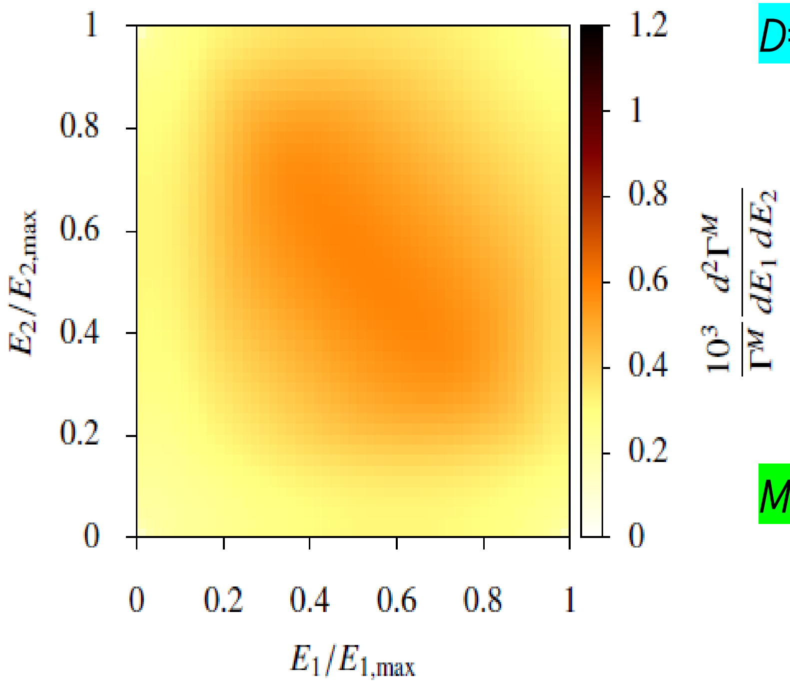
Different distribution, but the same total rate (DMCT)

$$\mathscr{M}^D = \mathscr{M}(p_1, p_2), \qquad \mathscr{M}^M = \frac{1}{\sqrt{2}}\big(\mathscr{M}(p_1, p_2) - \mathscr{M}(p_2, p_1)\big).$$

Dirac case



Majorana case

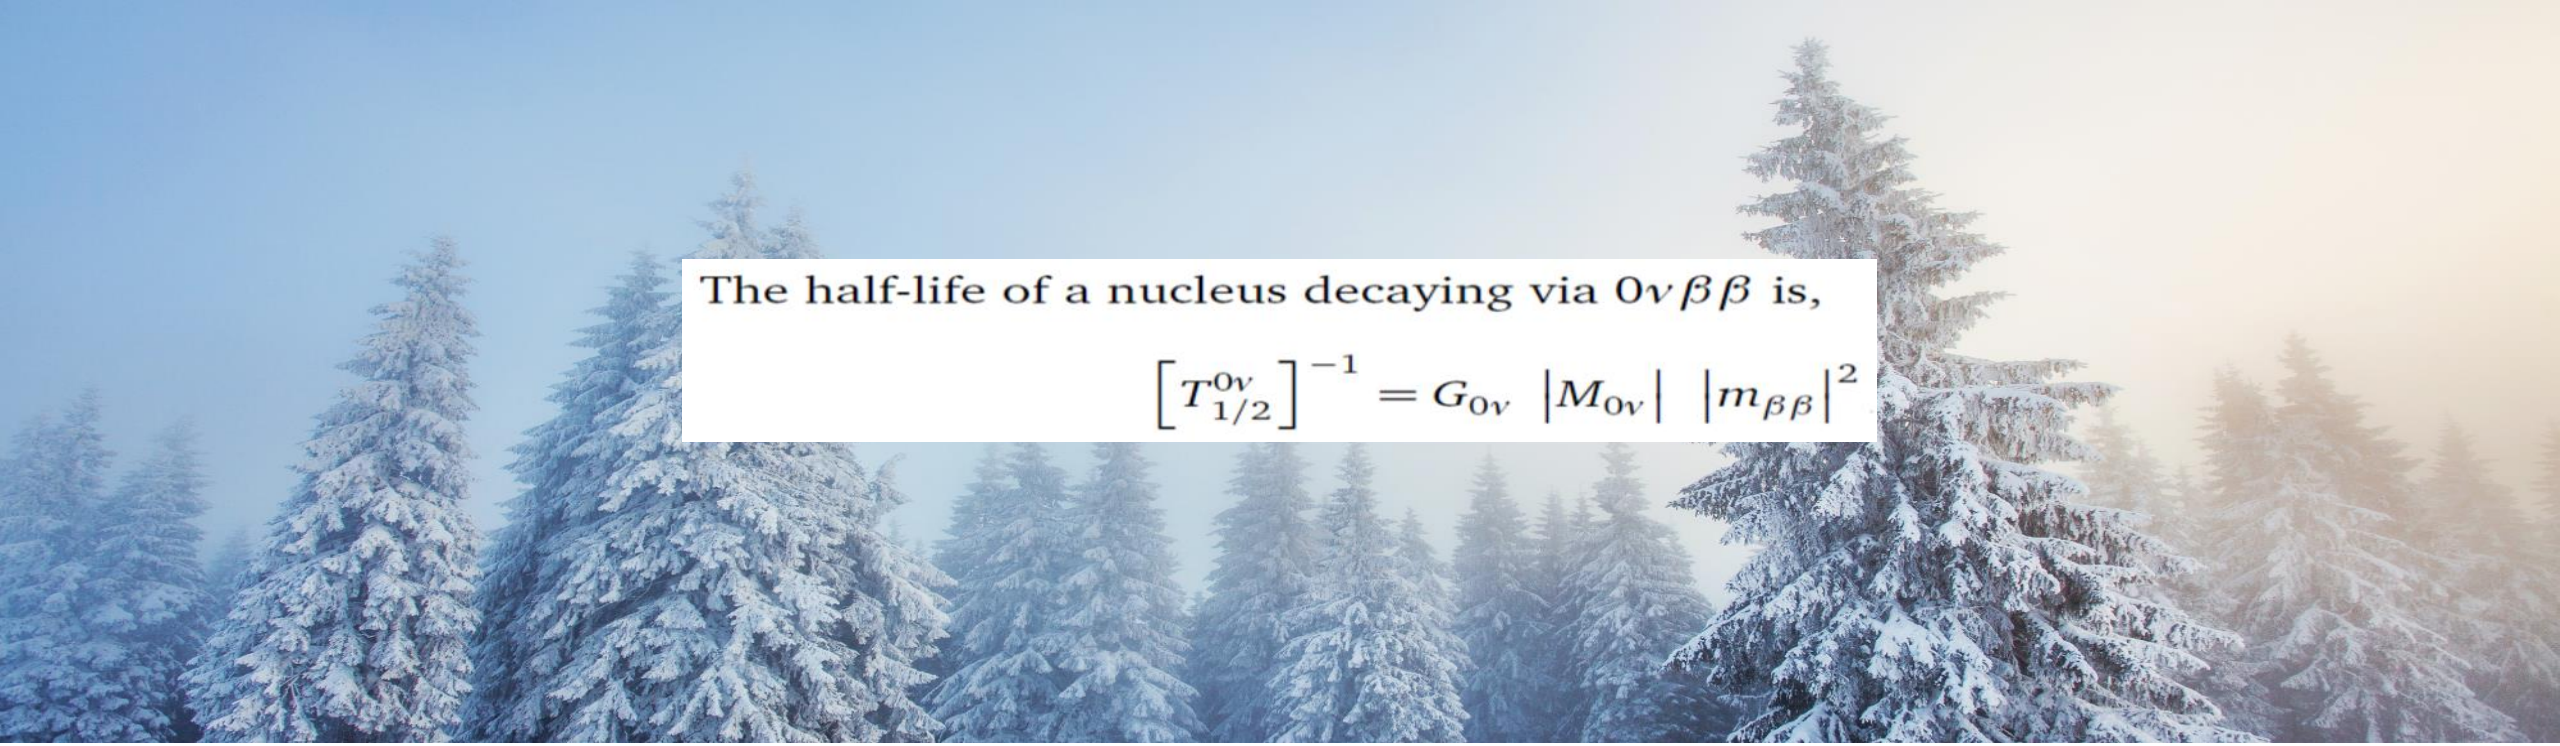


D=in general, no reason to be symmetric

M=always, must be symmetric

$$\underbrace{|\mathscr{M}(p_1, p_2)|^2}_{\text{Direct term}} \neq \underbrace{|\mathscr{M}(p_2, p_1)|^2}_{\text{Exchange term}}.$$

$$\iint \left(\left|\mathscr{M}^D\right|^2 - \left|\mathscr{M}^M\right|^2\right) \mathrm{d}^4p_1\, \mathrm{d}^4p_2 \quad \propto m_\nu^2.$$



The half-life of a nucleus decaying via $0\nu\beta\beta$ is,

$$\left[T_{1/2}^{0\nu}\right]^{-1} = G_{0\nu}\ \left|M_{0\nu}\right|\ \left|m_{\beta\beta}\right|^2$$

How to overcome pDMCT ?

New physics effects in neutrino interaction (beyond SM)

New Physics Effects to distinguish Majorana from Dirac

General Comments on New Physics Scenario [S.P.Rosen,PRL48(1982): W.Rodejohann etal,JHEP05(2017)]

Detailed study on $Z \to \nu_\ell \bar{\nu}_\ell$

Detailed study of $B \to K\nu\bar{\nu}, K \to \pi\nu\bar{\nu}$

Detailed study of $Z \to \nu_\ell \bar{\nu}_\ell$ (1)

Most general amplitude for Dirac neutrino

$$\mathcal{M}^D = \mathcal{M}(p_1, p_2) = -\frac{i\, g_Z}{2}\epsilon_\alpha \left[\bar{u}(p_1)\,\gamma^\alpha \left(C_V^\ell - C_A^\ell\,\gamma^5\right) v(p_2)\right],$$

$$\boxed{C_{V,A}^\ell = \frac{1}{2} + \varepsilon_{V,A}^\ell,}$$ $\varepsilon_{V,A}^\ell = 0.$ (SM)

Then,

$$\mathcal{M}^M = \frac{1}{\sqrt{2}}\left(\mathcal{M}(p_1, p_2) - \mathcal{M}(p_2, p_1)\right) = \frac{i\, g_Z\, C_A^\ell}{\sqrt{2}}\epsilon_\alpha \left[\bar{u}(p_1)\,\gamma^\alpha\,\gamma^5\, v(p_2)\right].$$

$$\left|\mathcal{M}^D\right|^2 = \frac{g_Z^2}{3}\left(\left((C_V^\ell)^2 + (C_A^\ell)^2\right)\left(m_Z^2 - m_\nu^2\right) + 3\left((C_V^\ell)^2 - (C_A^\ell)^2\right) m_\nu^2\right),$$

$$\left|\mathcal{M}^M\right|^2 = \frac{2\, g_Z^2\,(C_A^\ell)^2}{3}\left(m_Z^2 - 4\, m_\nu^2\right),$$

$$\left|\mathcal{M}^D\right|^2 - \left|\mathcal{M}^M\right|^2 = \frac{1}{2}\Big(\underbrace{\left|\mathcal{M}(p_1,p_2)\right|^2}_{\text{Direct term}} - \underbrace{\left|\mathcal{M}(p_2,p_1)\right|^2}_{\text{Exchange term}}\Big) + \underbrace{\mathrm{Re}\left(\mathcal{M}(p_1,p_2)^*\,\mathcal{M}(p_2,p_1)\right)}_{\text{Interference term}}.$$

such that

$$\left|\mathcal{M}^D\right|^2 - \left|\mathcal{M}^M\right|^2 = \frac{g_Z^2}{3}\left(\left((C_V^\ell)^2 - (C_A^\ell)^2\right)\left(m_Z^2 + 2\, m_\nu^2\right) + 6\,(C_A^\ell)^2\, m_\nu^2\right)$$
$$= \begin{cases} \dfrac{g_Z^2}{2} m_\nu^2, & \text{(for SM alone)} \\[2ex] \dfrac{g_Z^2}{3}\left(\varepsilon_V^\ell - \varepsilon_A^\ell\right) m_Z^2, & \text{(with NP but neglecting } m_\nu) \end{cases}$$

[DMCT at amplitude^2]

[DMCT x with NP]

Detailed study of $Z \to \nu_\ell \bar{\nu}_\ell$ (2)

Therefore, neglecting neutrino mass,

$$\Gamma^D(Z \to \nu_\ell \bar{\nu}_\ell) = \Gamma_Z^0 \left(1 + 2\,\varepsilon_V^\ell + 2\,\varepsilon_A^\ell\right),$$
$$\Gamma^M(Z \to \nu_\ell \bar{\nu}_\ell) = \Gamma_Z^0 \left(1 + 4\,\varepsilon_A^\ell\right),$$

$$\Gamma_Z^0 = \frac{G_F\, m_Z^3}{12\sqrt{2}\,\pi},$$

Then,

$$\Gamma_{Z,\mathrm{inv}} = \begin{cases} \Gamma_Z^0 \left(3 + 2 \sum_{\ell=e,\mu,\tau} \left(\varepsilon_V^\ell + \varepsilon_A^\ell\right)\right), & \text{(for Dirac neutrinos)} \\ \Gamma_Z^0 \left(3 + 4 \sum_{\ell=e,\mu,\tau} \varepsilon_A^\ell\right). & \text{(for Majorana neutrinos)} \end{cases}$$

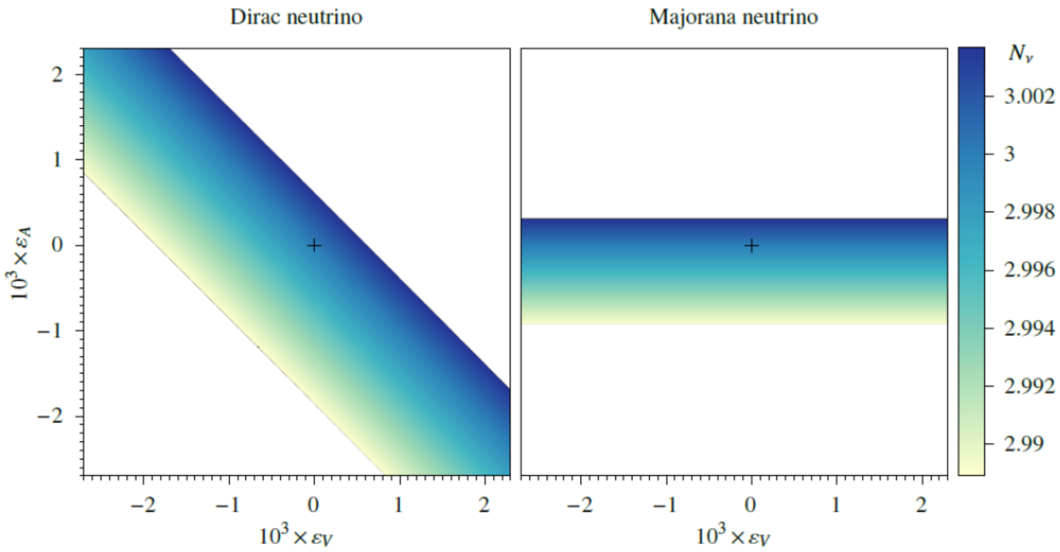
$$N_\nu = \Gamma_{Z,\mathrm{inv}}/\Gamma_Z^0 = 2.9963 \pm 0.0074.$$

[pdg(2021), PLB803(2020)]

$$\sum_{\ell=e,\mu,\tau} \left(\varepsilon_V^\ell + \varepsilon_A^\ell\right) = -0.0018 \pm 0.0037, \quad \text{(for Dirac neutrinos)}$$

$$\sum_{\ell=e,\mu,\tau} \varepsilon_A^\ell = -0.0009 \pm 0.0018, \quad \text{(for Majorana neutrinos)}$$

$$\varepsilon_{V,A}^e = \varepsilon_{V,A}^\mu = \varepsilon_{V,A}^\tau \equiv \varepsilon_{V,A}$$



Extra 2 [C.S. Kim, M. Murthy, D. Sahoo, arXiv:2106.11785 [PRD105(2022)];
C.S. Kim, arXiv:2307.05654 [EPJC83(2023)]]

only unmeasurable angle (θ) integrate out ➔ Overcoming DMCT constraint

Back-to-back muons, (easily measurable exception to DMCT)

$$B^0(p_B) \to \mu^-(p_-)\,\mu^+(p_+)\,\bar{\nu}_\mu(p_1)\,\nu_\mu(p_2),$$

In the rest frame of parent B meson,
IF muon- and muon+ are back-to back, ie. flying with 3 momenta of equal magnitude but opposite direction
➔ nu and nu-bar also back-to-back

$$E_1 = E_2 = E_\nu = m_B/2 - E_\mu$$

$$m_{\nu\nu}^2 = 4E_\nu^2$$

$$m_{\mu\mu}^2 = (m_B - 2E_\nu)^2$$

$$Y_m = \sqrt{(m_B/2 - E_\nu)^2 - m_\mu^2}$$

$$Y_n = \sqrt{E_\nu^2 - m_\nu^2}$$

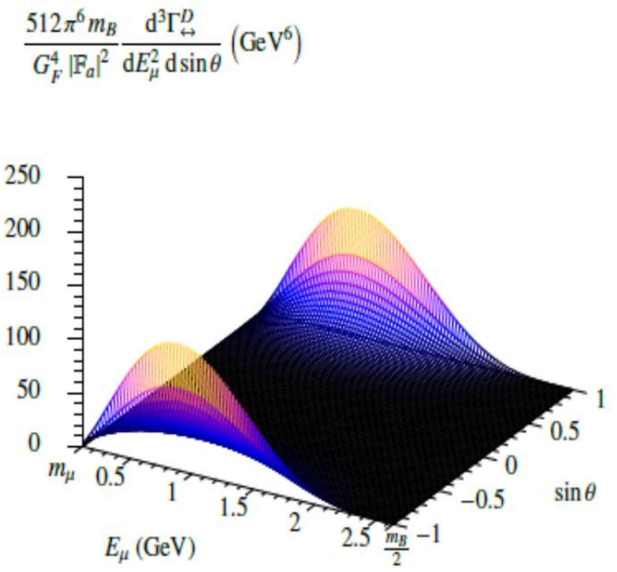
➔ All kinematic variables are calculable or measurable ,

Only the angle (between $\nu - \bar{\nu}$ and $\mu_- - \mu_+$) UNKNOWN

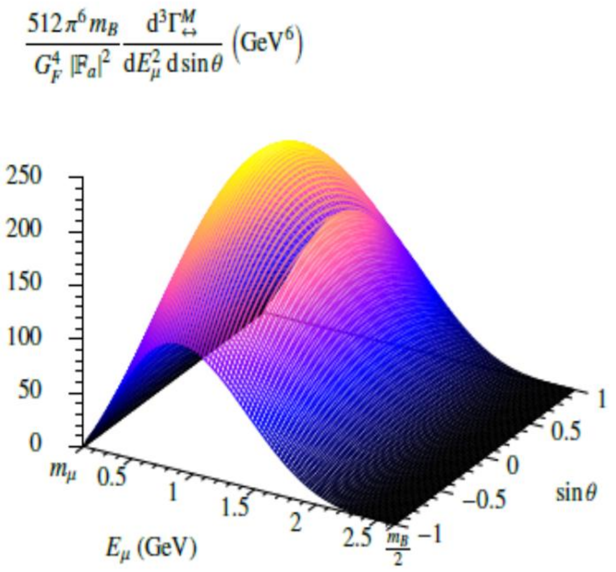
$$\frac{d\Gamma}{dE_\mu^2\,d\sin\theta} \rightarrow \frac{d\Gamma}{dE_\nu^2\,d\sin\theta}$$

Need not integrate out nu-nubar full phase space,
only unmeasurable angle (θ) integrate out ➔ Overcoming DMCT constraint

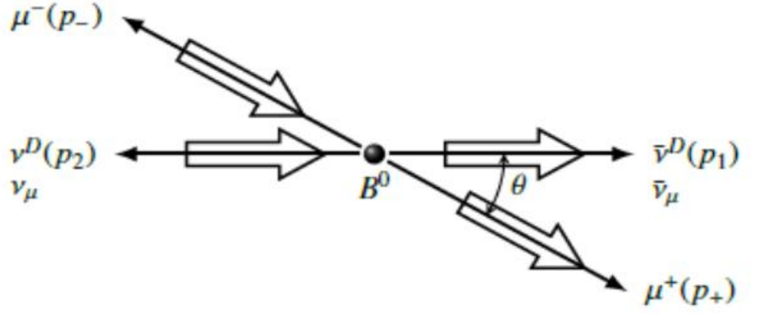
Back-to-back muons in $B^0(p_B) \to \mu^-(p_-)\mu^+(p_+)\bar{\nu}_\mu(p_1)\,\nu_\mu(p_2),$



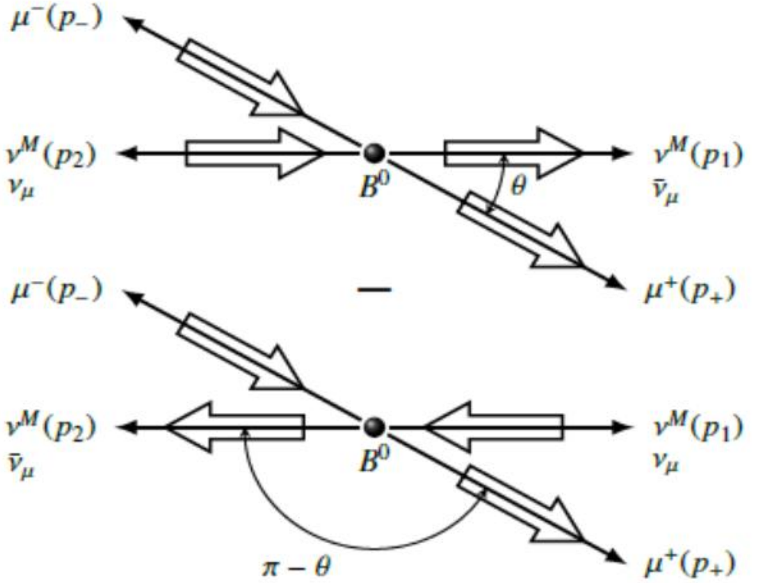
(a) Three dimensional view of the differential decay rate for Dirac case with an appropriate normalization as mentioned.



(b) Three dimensional view of the differential decay rate for Majorana case with an appropriate normalization as mentioned.



(a) Helicity configuration involving Dirac neutrinos, $\nu_\mu \equiv \nu^D$, $\bar{\nu}_\mu \equiv \bar{\nu}^D$.



(b) Helicity configuration involving Majorana neutrinos, $\nu_\mu = \bar{\nu}_\mu \equiv \nu^M$.

$$|\mathscr{M}^D_{\leftrightarrow}|^2 \propto \underbrace{(1-\cos\theta)^2}_{\text{Direct term}}.$$

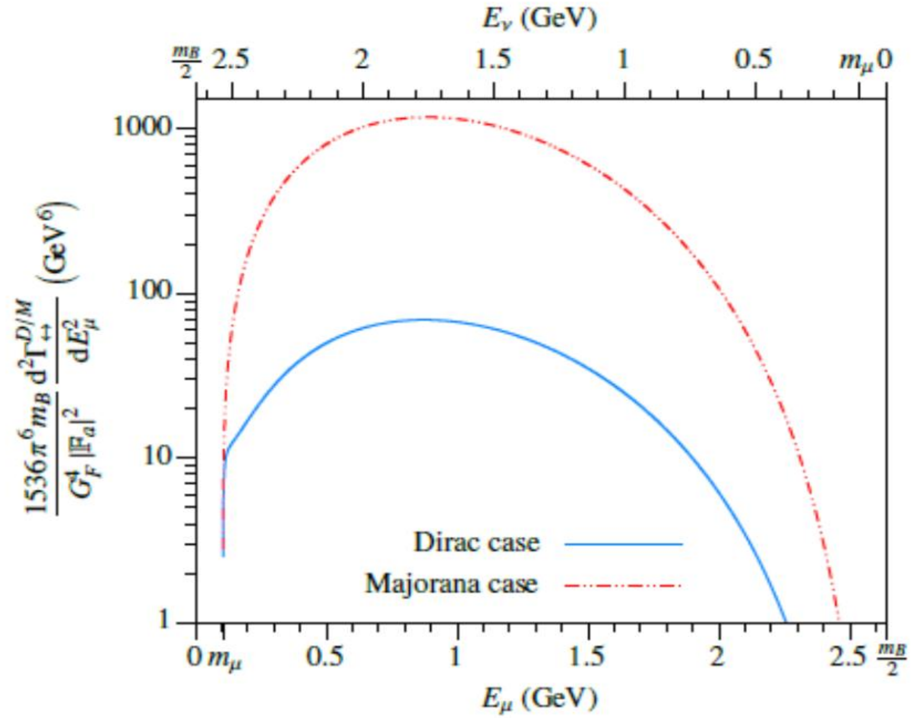
$$|\mathscr{M}^M_{\leftrightarrow}|^2 \propto \frac{1}{2}\left[\underbrace{(1-\cos\theta)^2}_{\text{Direct term}} + \underbrace{(1-\cos(\pi-\theta))^2}_{\text{Exchange term}} - \underbrace{\mathcal{O}(m_\nu^2)}_{\text{Interference term}}\right] \simeq 1+\cos^2\theta.$$

Back-to-back muons in $B^0(p_B) \to \mu^-(p_-)\mu^+(p_+)\bar{\nu}_\mu(p_1)\nu_\mu(p_2),$

$$\frac{d^3\Gamma^D_{\leftrightarrow}}{dE_\mu^2\, d\sin\theta} = \frac{G_F^4\, |\mathbb{F}_a|^2 \left(m_B - 2E_\mu\right)^4 K_\mu}{512\,\pi^6\, m_B\, E_\mu} \left(E_\mu - K_\mu \cos\theta\right)^2,$$

$$\frac{d^3\Gamma^M_{\leftrightarrow}}{dE_\mu^2\, d\sin\theta} = \frac{G_F^4\, |\mathbb{F}_a|^2 \left(m_B - 2E_\mu\right)^4 K_\mu}{512\,\pi^6\, m_B\, E_\mu} \left(E_\mu^2 + K_\mu^2 \cos^2\theta\right),$$

$$K_\mu = \sqrt{E_\mu^2 - m_\mu^2}$$



(c) Comparison of muon energy distributions between Dirac and Majorana cases in the back-to-back scenario.

$$BR(D - M) = \int \left(D_{\leftrightarrow} - M_{\leftrightarrow}\right) \neq m_\nu^2$$

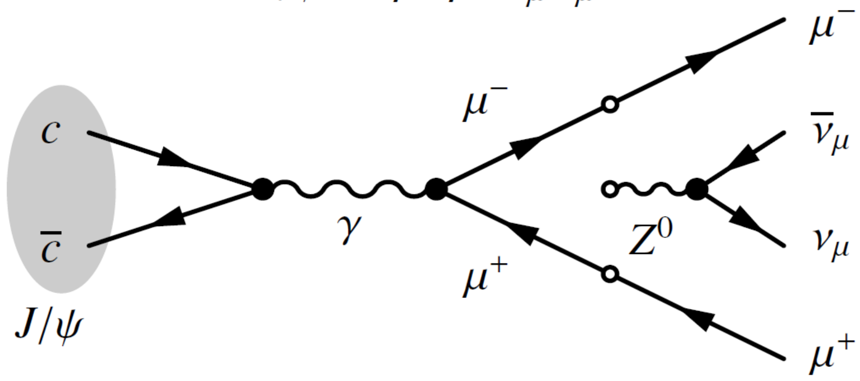
$$\mathcal{B}^D_{\leftrightarrow} = \Gamma^D_{\leftrightarrow}/\Gamma_B \approx 1.1 \times 10^{-12}\ \text{GeV}^{-2} \times |\mathbb{F}_a|^2,$$

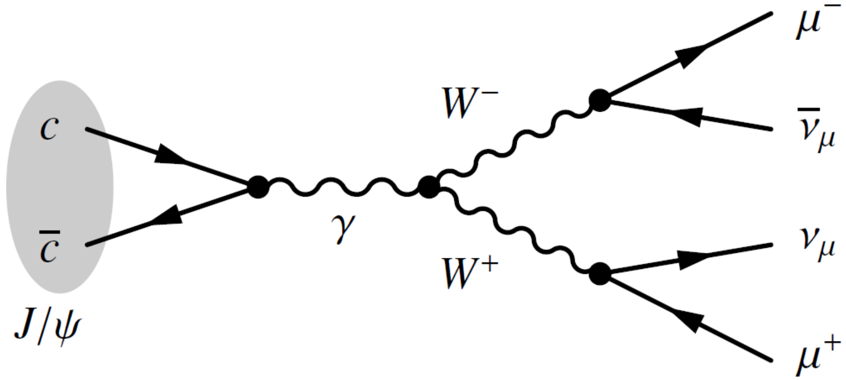
$$\mathcal{B}^M_{\leftrightarrow} = \Gamma^M_{\leftrightarrow}/\Gamma_B \approx 1.8 \times 10^{-11}\ \text{GeV}^{-2} \times |\mathbb{F}_a|^2,$$

Discussions on $J/\psi \to \mu^+\mu^-\nu_\mu\bar{\nu}_\mu$ -- B2B muons (1)

Cases for $J/\psi \to \mu^+\mu^-\nu_\mu\bar{\nu}_\mu$ at BES III , $\Upsilon(1s) \to \mu^+\mu^-\nu_\mu\bar{\nu}_\mu$ at Belle2

$J/\psi \to \mu^-\mu^+\nu_\mu\bar{\nu}_\mu$





** Present measurements:

$Br(B^0 \to \mu^+\mu^-) = (1.1 \pm 1.4) * 10^{-10}$ FCNC decay via photonic Penguin

$B^0(p_B) \to \mu^-(p_-)\mu^+(p_+)\bar{\nu}_\mu(p_1)\nu_\mu(p_2),$ Doubly weak charged current decay

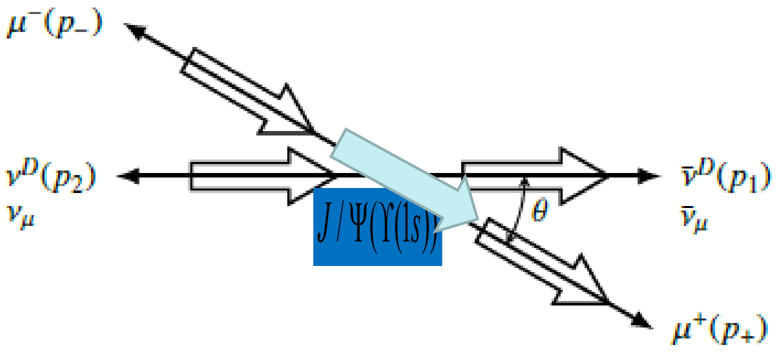
$$Br(J/\Psi \to \mu^+\mu^-) = (5.961 \pm 0.033)\%$$

$$Br(\Upsilon(1s) \to \mu^+\mu^-) = (2.48 \pm 0.05)\%$$

Discussions on $J/\psi \to \mu^+\mu^-\nu_\mu \bar{\nu}_\mu$ -- B2B muons (2)

Cases for $J/\psi \to \mu^+\mu^-\nu_\mu \bar{\nu}_\mu$ at BES III , $\Upsilon(1s) \to \mu^+\mu^-\nu_\mu \bar{\nu}_\mu$ at Belle2

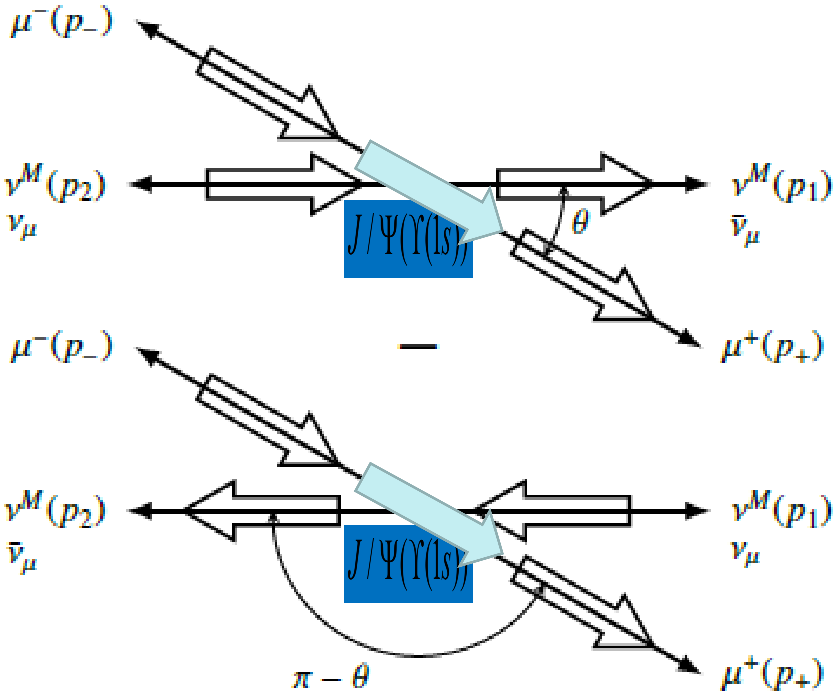
** (simple rough) Helicity Consideration



(a) Helicity configuration involving Dirac neutrinos, $\nu_\mu \equiv \nu^D, \bar{\nu}_\mu \equiv \bar{\nu}^D$.

$$\left|\mathfrak{M}^D_{\leftrightarrow}\right|^2 \propto (1+\cos\theta)^2$$

$$\left|\mathfrak{M}^M_{\leftrightarrow}\right|^2 \propto 1+\cos^2\theta$$



(b) Helicity configuration involving Majorana neutrinos, $\nu_\mu = \bar{\nu}_\mu \equiv \nu^M$.

Extra 3 [C.S. Kim, arXiv:2307.05654 [EPJC83(2023)]]

- Issues in pDMCT (Analytic Continuity & F-D statistics)

1. Analytic Continuity

   Is there any one-to-one correspondence between Dirac and Majorana neutrinos in the massless limit, $m_\nu \rightarrow 0$?

2. Anti-Symmetrization of Amplitude

   Should the amplitude be anti-symmetrized for pair of Majorana neutrinos of the same flavor ?

Analytic Continuity when m → 0 limit ? (1)

** Is there smooth transition between Majorana to Dirac neutrinos under m → 0 limit ??

1) *In the context of a specific process and observable,*
there is indeed no one-to-one correspondence between the Dirac and Majorana neutrino scenarios.

E.g. For $Z \to \nu_\ell \bar{\nu}_\ell$

$$\left|\mathcal{M}^D\right|^2 - \left|\mathcal{M}^M\right|^2 = \frac{g_Z^2}{3}\left(\left((C_V^\ell)^2 - (C_A^\ell)^2\right)\left(m_Z^2 + 2\,m_\nu^2\right) + 6\,(C_A^\ell)^2\,m_\nu^2\right)$$
$$= \begin{cases} \dfrac{g_Z^2}{2} m_\nu^2, & \text{(for SM alone)} \\ \dfrac{g_Z^2}{3}\left(\varepsilon_V^\ell - \varepsilon_A^\ell\right) m_Z^2, & \text{(with NP but neglecting } m_\nu) \end{cases}$$

$$C_{V,A}^\ell = \frac{1}{2} + \varepsilon_{V,A}^\ell, \qquad \varepsilon_{V,A}^\ell = 0.\ \text{(SM)}$$

Even within SM, *doubly weak charged current decay processes*, such as $B^0 \to \mu^- \mu^+ \nu_\mu \bar{\nu}_\mu$, give

$$\left|\mathcal{M}^D\right|^2 - \left|\mathcal{M}^M\right|^2 \not\propto m_\nu^2.$$

[C.S. Kim etal, arXiv:2106.11785 [PRD105(2022)]

Analytic Continuity when m → 0 limit ?   (2)

** Is there smooth transition between Majorana to Dirac neutrinos under m → 0 limit ??

2) *Now assuming Standard Model Lagrangian*, **due to the (V-A) structure of weak interaction,**
always **only** $\nu_L, \bar{\nu}_R$ **are produced (and detected).**
Assuming $mass(\nu) = 0$, **chirality of neutrinos is conserved and invariant.**
And $\nu_L, \bar{\nu}_R$ *can be* **distinguished by weak charged current interaction.**

➔ **massless** $\nu_L, \bar{\nu}_R$ are **Dirac neutrino**   (No mass-less Majorana neutrino exists).

3) *Assuming* $mass(\nu) \neq 0$, **chirality of neutrinos is not conserved (still invariant),** as m → 0.

space-time evolution

$$i\gamma^\mu \partial_\mu \psi_R = m\,\psi_L,$$
$$i\gamma^\mu \partial_\mu \psi_L = m\,\psi_R.$$

$$\psi_L \to \begin{pmatrix} \frac{m}{E}\psi_R \\ \psi_L \end{pmatrix}$$

$$\begin{Bmatrix} m \to 0 \\ E \neq 0 \end{Bmatrix} \qquad \begin{Bmatrix} m \to 0 \\ E \to 0 \end{Bmatrix}$$

$$\frac{m}{E} \to 0 \qquad \frac{m}{E} \sim \text{finite}$$

(relevant parameter, not m, but m/E → 0)

Analytic Continuity when m → 0 limit ?   (3)

** Is there smooth transition between Majorana to Dirac neutrinos under m → 0 limit ??

4) *Most importantly,* ***Quantum Statistics DEPENDS*** *on* ***Spin & Identicalness of neutrino,***
not DEPENDS *on* ***Mass of neutrino*** *!!*

E.g. For $$B^0(p_B) \to \mu^-(p_-)\mu^+(p_+)\bar{\nu}_\mu(p_1)\nu_\mu(p_2),$$

if $\nu = \text{Dirac}$ $$\mathcal{M}^D = \mathcal{M}(p_1, p_2),$$

if $\nu = \text{Majorana}$ $$\mathcal{M}^M = \frac{1}{\sqrt{2}}\left(\mathcal{M}(p_1,p_2) - \mathcal{M}(p_2,p_1)\right).$$ (for $m_\nu = 0$ or $m_\nu \neq 0$)

Therefore, even if $\Gamma_D = \Gamma_M(m_\nu \to 0)$, possibly $d\Gamma_D \neq d\Gamma_M(m_\nu \to 0)$

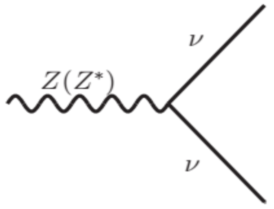
→ If we can deduce e.g. E_ν , we can find $\frac{d\Gamma_D}{dE_\nu} \neq \frac{d\Gamma_M}{dE_\nu}$ independent of m_ν

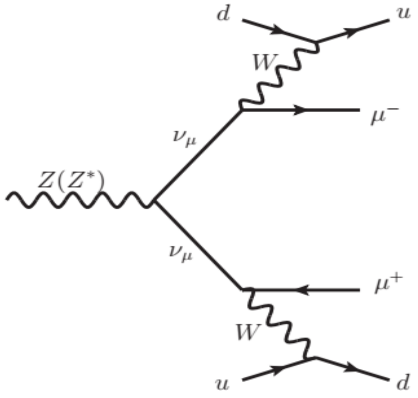
Anti-symmetrization of Amplitude : F-D Statistics

** Should the amplitude be anti-symmetrized for pair of Majorana neutrinos of the same flavor ??

1) Quantum statistics requires absolutely identical indistinguishable particles.

2) Quantum measurement effect is analogous to the well-known fact that the interference pattern in a double slit experiment is destroyed if one could somehow know through which slit the photon has passed.



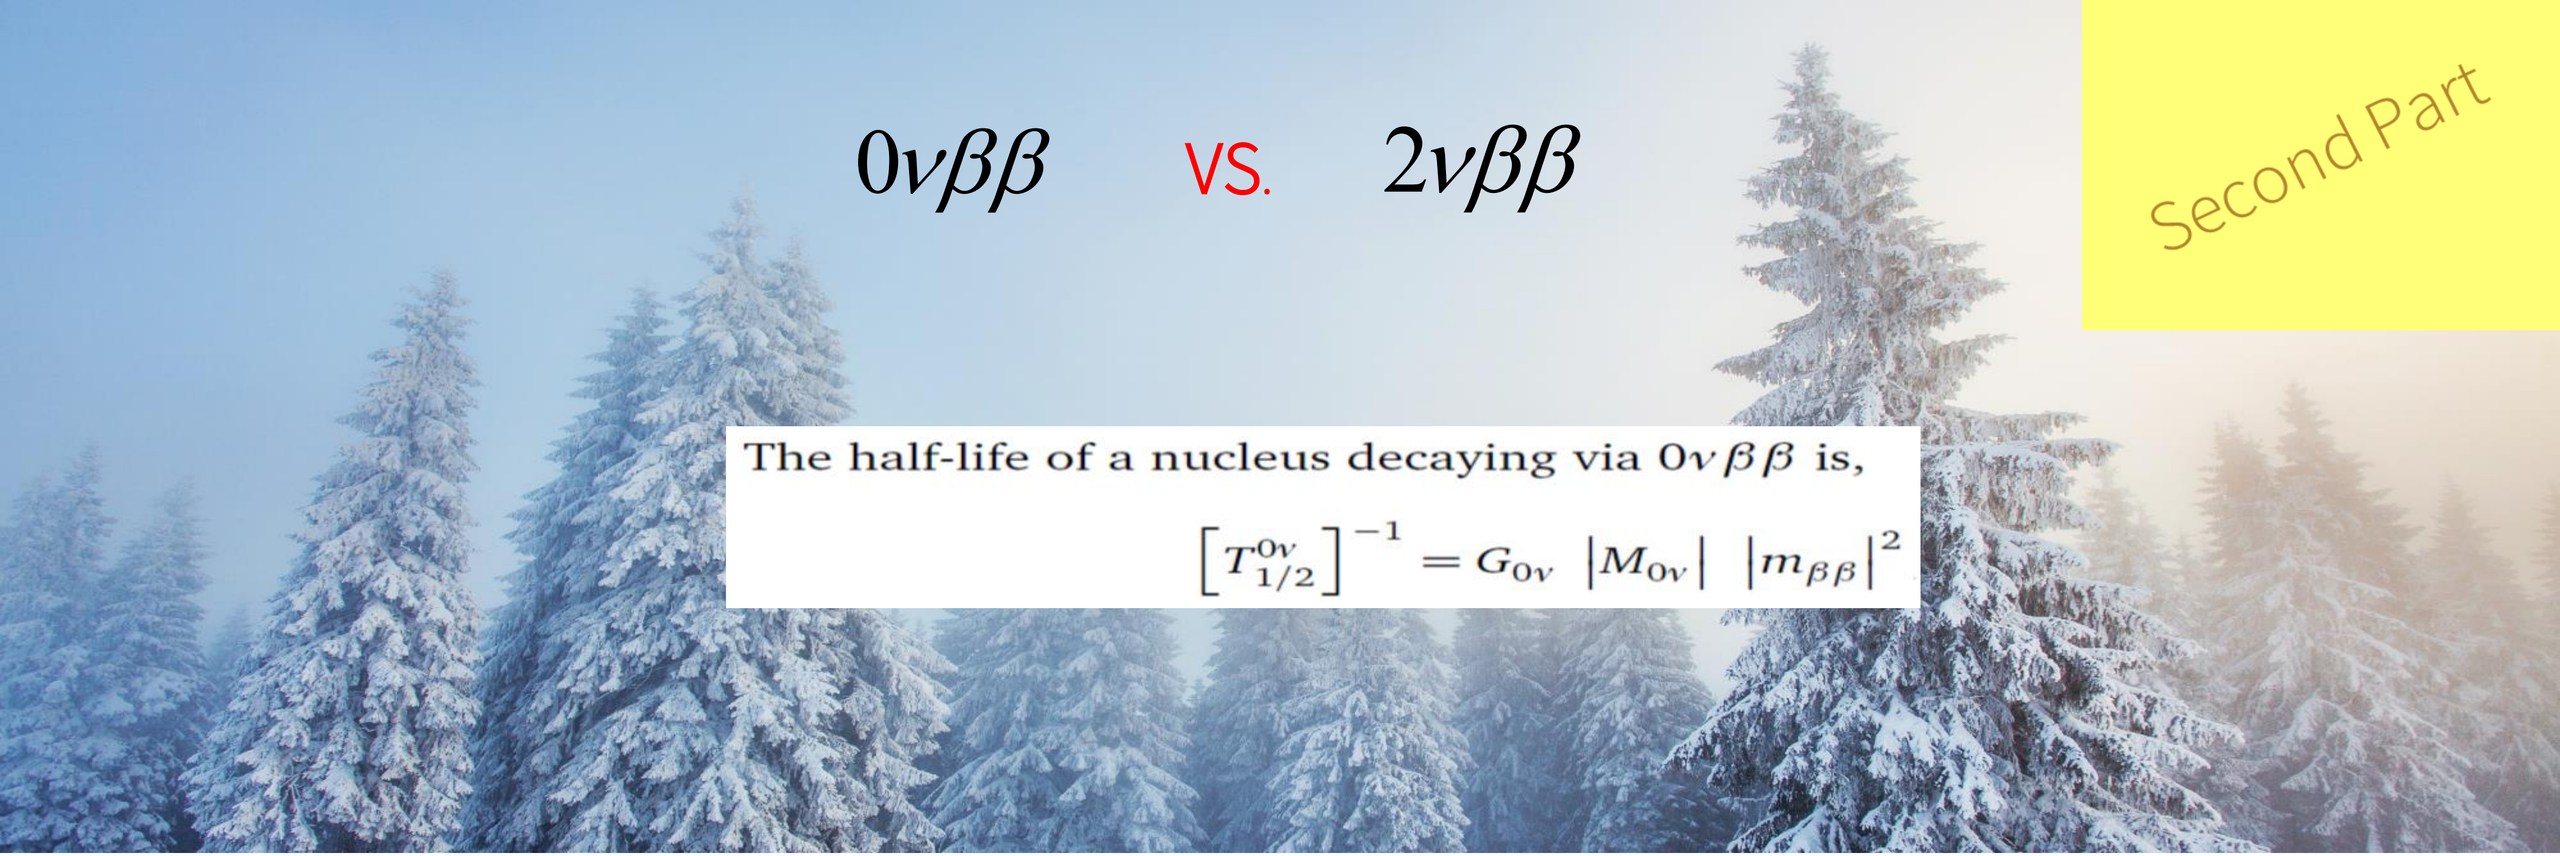


➔ requires a method deducing E (or p) of neutrino without destroying quantum effects.

Need Anti-symmetrization

No Anti-symmetrization once we know $\nu_1 \neq \nu_2$

(➔ similar to the double slit experiment)



Second Part

$0\nu\beta\beta$ VS. $2\nu\beta\beta$

The half-life of a nucleus decaying via $0\nu\beta\beta$ is,

$$\left[T_{1/2}^{0\nu}\right]^{-1} = G_{0\nu}\ \left|M_{0\nu}\right|\ \left|m_{\beta\beta}\right|^2$$

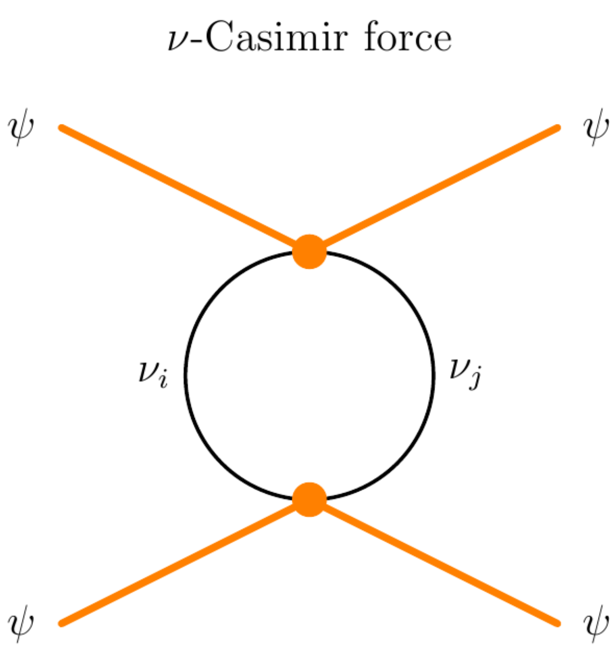
Alternatives to $0\nu\beta\beta$ ($\Delta L = 2$ process)

Neutrino Casimir Force
EDM & MDM of neutrinos
Fermi-Dirac Statistics for Fermion (nu) – Quantum Statistics
Quantum Statistics + $(2\nu\beta\beta)$

Alternative to 0nuBB (1) – Neutrino Casimir force

Principle: Exchange of pair of neutrinos can give rise to long-range quantum force (aka neutrino Casimir force or the neutrino exchange force) between macroscopic objects, and the effective potential can differentiate Dirac and Majorana neutrinos.

G Feinberg, J Sucher, PRD166(1968)
Phys. Rev. D 101, no.11, 116006 (2020); JHEP 09, 122 (2020)
arXiv:2209.07082 [hep-ph]



Issue: The potential (and hence the force) is proportional to product of the tiny neutrino masses in the loop.

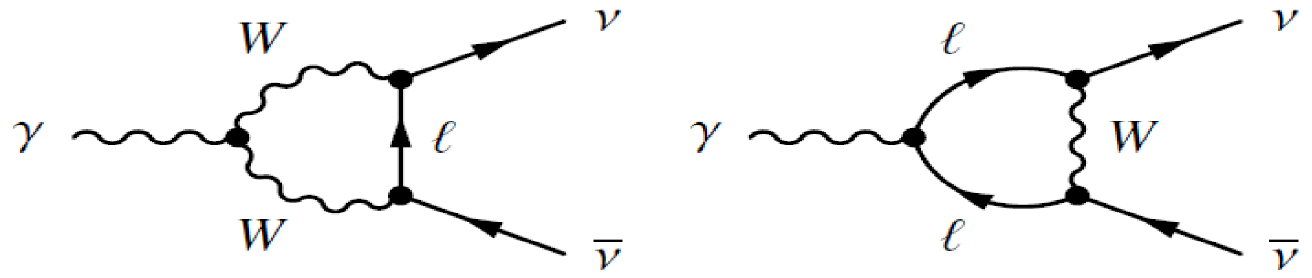
** Thermal fluctuation, van der Waals force

** Very weak force. For $r > 1$ nm, Gravitational force between two protons is bigger than this force.

Status: Experimental study is still awaited.

Alternative to 0nuBB (2) – e.d.m. & m.d.m. of Neutrino

- Neutrinos: electrically neutral ($Q_\nu = 0$).
  But might carry non-zero electric and magnetic dipole moments.
- Neutrino has no interaction with photon at tree-level.
  At one loop-level involving charged lepton and W boson in loop such interaction is allowed.



- CPT invariance prohibits Majorana neutrinos to have any electric and magnetic dipole moment. Loop effects also confirm this, following quantum statistics in $\gamma^* \to \nu\overline{\nu}$.

$$\text{edm} = 0 = \text{mdm}, \quad \text{(Majorana)}$$

$$\text{edm} \neq 0 \neq \text{mdm}. \quad \text{(Dirac)}$$

- Such striking differences in electromagnetic properties of Dirac and Majorana neutrinos vanishes as $m_\nu \to 0 \implies$ DMCT.
  [B. Kayser, Phys. Rev. D **26**, 1662 (1982).]

Alternative to 0nuBB (3) – Quantum Statistics (best option)

[CSK,MM,DS, 2106.11785, PRD105,113005(2022)]

[CS Kim, 2307.05654, EPJC83(2023)]

Majorana neutrinos

Quantum statistics

Final state

$\nu\ \nu$ $\overline{\nu}\ \overline{\nu}$ | $\nu\ \overline{\nu}$

Anti-symmetrization for both Dirac and Majorana cases

Can not be used to distinguish between Dirac and Majorana cases

Anti-symmetrization for only Majorana case

Can be used to distinguish between Dirac and Majorana cases

Allowed within SM

Minimal final state: $\ell^-\ell^+\nu_\ell\overline{\nu}_\ell$
Preference: $\ell=\mu$. $\ell=e$ has shorter track and $\ell=\tau$ has low reconstruction efficiency.
Decay mode: $B^0\to\mu^-\mu^+\nu_\mu\overline{\nu}_\mu$
Experiment: Belle II.
$\overline{B}$ is hadronically reconstructed.

(1 to 4 body process)
Many observables to deduce E(nu) !!

B^0 (B_s)→ mu mu(Z^* → nu nu)
not good, too small BR (FCNC)

Alternative to 0nuBB (4) – Quantum Statistics + $(2\nu\beta\beta)$

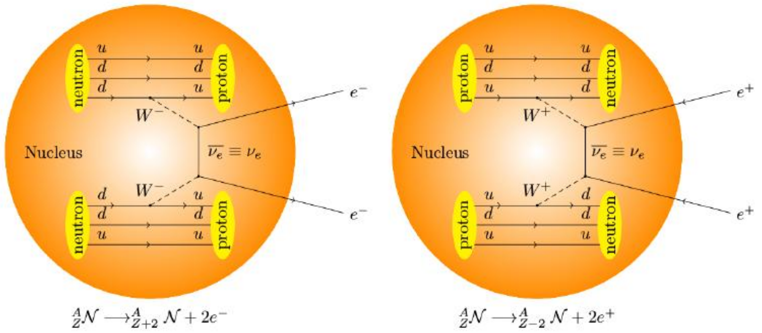
$0\nu\beta\beta$ is only for the evidence of
"Lepton Number Violation",

➔ NOT unequivocal evidence of
active (sub-eV) neutrino being
Majorana neutrino .

eg. heavy sterile neutrinos can give the same effects

HOWEVER, $2\nu\beta^{+}\beta^{-}$ ($\nu\bar{\nu}$ not $\nu\nu, \bar{\nu}\bar{\nu}$)
can be w/ Quantum Statistics !!

❖ Process:



$$ {}^{A}_{Z}N \to {}^{A}_{Z+2}N + 2e^{-} $$

$$ {}^{A}_{Z}N \to {}^{A}_{Z+2}N + 2e^{-} + (2\bar{\nu}) $$

$$ {}^{A}_{Z}N \to {}^{A}_{Z}N + e^{-} + e^{+} + (\bar{\nu} + \nu) $$ ✖

$$ e^{-} + {}^{A}_{Z}N \to {}^{A}_{Z}N + e^{-} + (\bar{\nu} + \nu) $$ −

$$ e^{+} + {}^{A}_{Z}N \to {}^{A}_{Z}N + e^{+} + (\bar{\nu} + \nu) $$ −

$$ \gamma + {}^{A}_{Z}N \to {}^{A}_{Z}N + e^{-} + e^{+} + (\bar{\nu} + \nu) $$ ○

Extra 4 [ ]

- Issues in the process $\gamma + {}^{A}_{Z}N \rightarrow {}^{A}_{Z}N + e^{-} + e^{+} + (\bar{\nu} + \nu)$

0. 2 Possible Processes (Double Beta vs. Electro-Magnetic X Z* -> nu nu)

1. Scales and factorization

   Physics Scale of gamma to N, and is the process factorizable ? $\Gamma(\gamma + {}^{A}_{Z}N \rightarrow {}^{A}_{Z}N + ...) = \mathrm{Prob.}(\gamma N) \times \Gamma({}^{A}_{Z}N \rightarrow {}^{A}_{Z}N + ...)$?

2. Probability of $\Gamma(\gamma + N \rightarrow N) \propto \mathrm{Prob.}(\gamma \mathrm{N})$

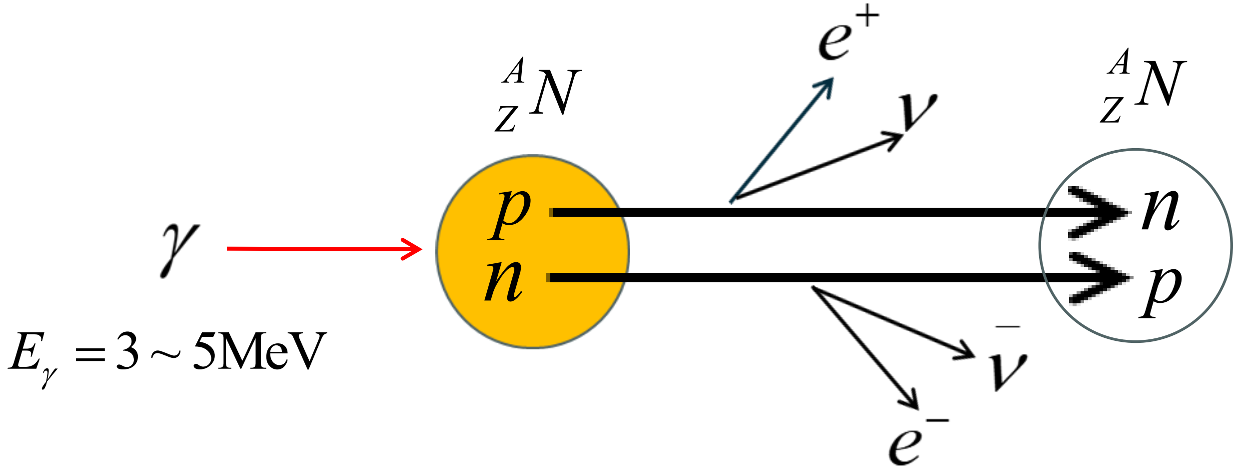
3. Electro-magnetic X weak neutral $\gamma + {}^{A}_{Z}N \rightarrow {}^{A}_{Z}N + e^{+} + e^{-} + (\bar{\nu} + \nu)$

3.1 Bethe-Heitler (BH) vs. Virtual Compton Scattering (VCS) of e+ e- production

4. Is the final N moving as recoil motion ?

0. 2 Possible Processes, $\gamma + {}^A_Z N \rightarrow {}^A_Z N + e^- + e^+ + (\bar{\nu} + \nu)$

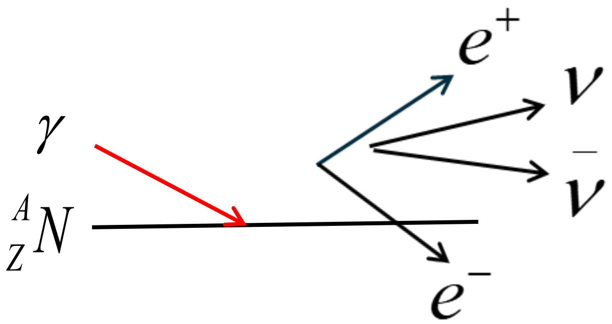
1) Double beta decays of energetic N

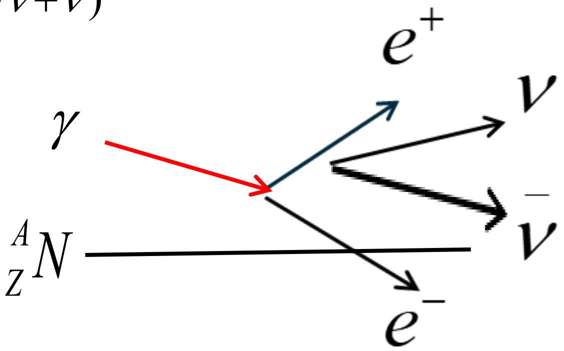


: factorizable

2) Electro-magnetic X weak neutral $(\gamma^* \rightarrow e^- + e^+)(Z^* \rightarrow \bar{\nu} + \nu)$

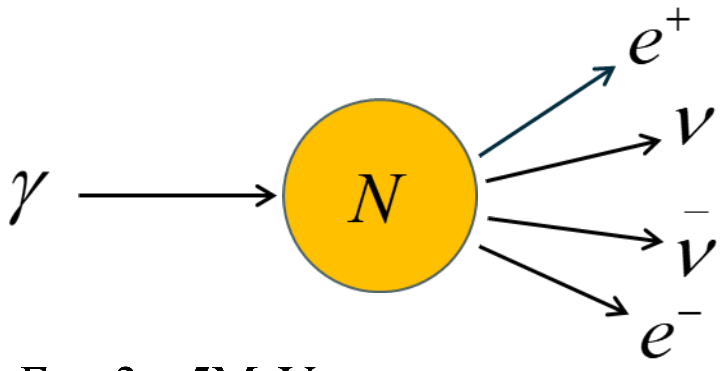
factorizable :





: non-factorizable

1. Scales and Factorization: $\Gamma(\gamma+{}_Z^AN \to {}_Z^AN+...) = \text{Prob.}(\gamma N)\times\Gamma({}_Z^AN \to {}_Z^AN+....)$



$E_\gamma = 3 \sim 5\text{MeV}$

$\lambda(\gamma) \sim 100\text{fm} \quad \lambda(\text{p,n}) \sim 1\text{fm}$

$$\gamma + {}_Z^AN \to {}_Z^AN + e^- + e^+ + (\bar{\nu}+\nu)$$

(eg.) For double beta decay process:

Incoming photon CANNOT interact DIRECTLY to (n,p) of N, nor to (e e nu nu) in beta decay process of (n,p) !!

$$1.02\text{MeV} < E(\gamma) < M({}_Z^AN^*) - M({}_Z^AN)$$

$$\gamma + {}_Z^AN \to (\text{energetic})\, {}_Z^AN \to {}_Z^AN + e^- + e^+ + (\bar{\nu}+\nu)$$

$$\gamma + {}_Z^AN \to {}_Z^AN + e^- + e^+ + (\bar{\nu}+\nu)$$

$[\gamma + N \to N][N \to N + ee\nu\nu]$ if factorized

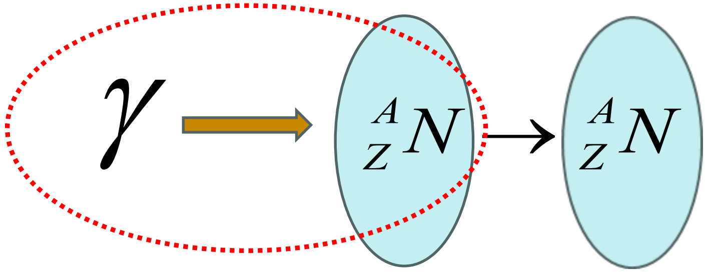
** factorized due to MeV scale ($\gamma + N \to N$) and GeV scale ($n \to p + e^- + \bar{\nu}$)

$[\gamma + N \to N][N \to N + ee\nu\nu]$

$[\gamma + N \to N][\gamma^* \to ee\nu\nu]$

$$\Gamma(\gamma+{}_Z^AN \to {}_Z^AN+...) = \text{Prob.}(\gamma N)\times\Gamma({}_Z^AN \to {}_Z^AN+....)$$

2. Probability of $\Gamma(\gamma + N \rightarrow N) \propto \text{Prob.}(\gamma\text{N})$ in $\gamma + {}^{A}_{Z}N \rightarrow {}^{A}_{Z}N + e^{-} + e^{+} + (\bar{\nu}+\nu)$



$E_{\gamma} = 3 \sim 5\text{MeV}$

γ = (squeezed) Gamma-ray Laser Photon / Compton back-scattered gamma ray

$$\text{Prob.}(\gamma N) = \text{Luminosity}(\propto n_{\gamma}) \times \text{Cross-section}(\sigma_{\gamma N})$$

$\text{Cross-section}(\sigma_{\gamma N})$ ~ 2.1X10^-24 cm^2 (XCOM Data)

Gamma rays cannot penetrate deep into target materials (at best ~ O(5~10) cm)

[for Germanium and ~5MeV gamma rays on density=5.3g/cm^3]

n_{γ} capable of creating 1e5/sec photons with their setup in NewSUBARU

[2304.08935]

$$\Gamma(\gamma + {}^{A}_{Z}N \rightarrow {}^{A}_{Z}N + ...) = \text{Prob.}(\gamma N) \times \Gamma({}^{A}_{Z}N \rightarrow {}^{A}_{Z}N + ...)$$

$$\boxed{\text{Prob.}(\gamma N) = F_{\gamma} n_{t} \sigma_{\gamma N} \approx \left(\frac{10^{5}}{\text{sec}}\right)\left[\left(\frac{6\times10^{23}}{72.6\text{g}}\right)\left(\frac{5.326\text{g}}{\text{cm}^{3}}\right)(5\text{cm}) = 2.2\times10^{23}/\text{cm}^{2}\right]\left[2.1\times10^{-24}\text{cm}^{2}\right] = \frac{4.6\times10^{4}}{\text{sec}}}$$

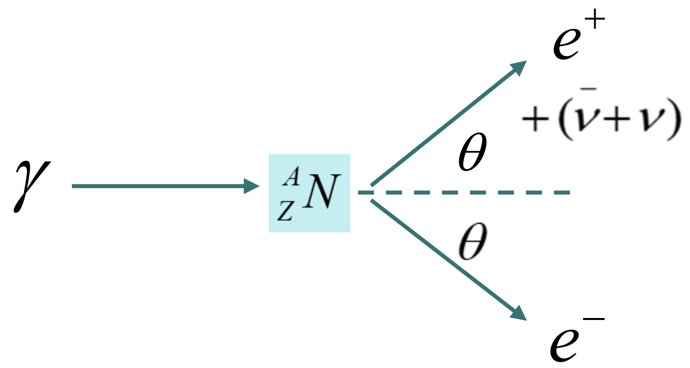
$$\Longrightarrow \quad \Gamma(\gamma + {}^{A}_{Z}N \rightarrow {}^{A}_{Z}N + ...) \approx \frac{4.6\times10^{4}}{\text{sec}} \times \Gamma({}^{A}_{Z}N \rightarrow {}^{A}_{Z}N + ...)$$

3. Electron-Positron Production in $\gamma + {}^A_Z N \rightarrow {}^A_Z N + e^+ + e^-$ $+(\bar{\nu}+\nu)$

For Electro-Magnetic X (Z* -> nu nu):

In free space (vacuum) : $\gamma \rightarrow e^+ + e^-$ $+(\bar{\nu}+\nu)$ ✖

With matter (nucleus) : $\gamma + {}^A_Z N \rightarrow {}^A_Z N + e^+ + e^-$ $+(\bar{\nu}+\nu)$ ○



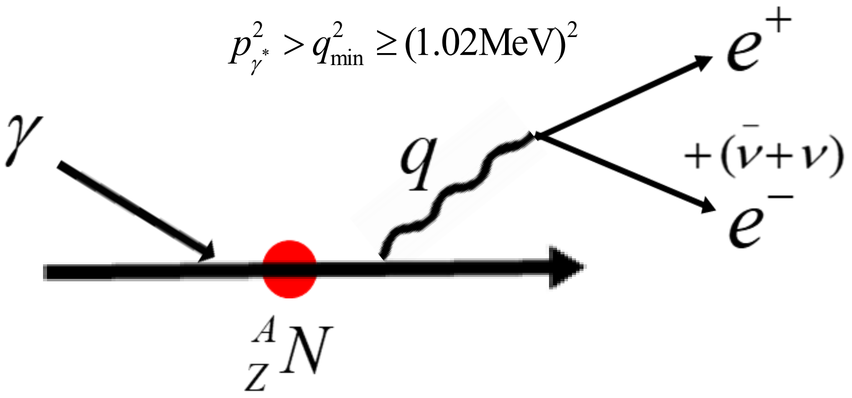
2 issues: 1) Is factorizable ?

2) Is the final N moving ?

$E(\gamma) > 1.02\text{MeV}$ $$\gamma + {}^A_Z N \rightarrow {}^A_Z N + \gamma^*(\rightarrow e^+ + e^-)$$

$$h\nu = 2m_e + E_{e^+} + E_{e^-}$$

$p^2_{\gamma^*} > q^2_{\min} \geq (1.02\text{MeV})^2$



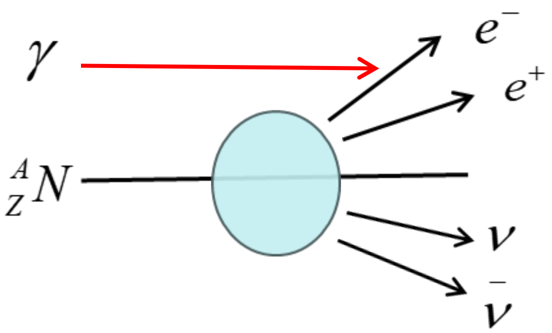
If factorized, as discussed, due to the physic scale of the process:

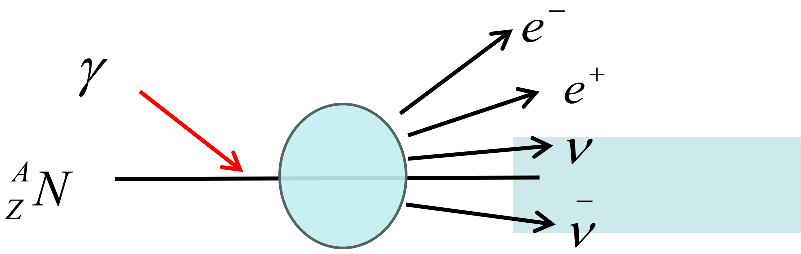
$$\Gamma(\gamma + {}^A_Z N \rightarrow {}^A_Z N + e^+ + e^-) \approx \text{Prob.}(\gamma N) \times \Gamma(\gamma^*_{(p^2_\gamma \sim q^2_{\min})} \rightarrow e^- + e^+)$$

$$[\gamma + N \rightarrow N][\gamma^* \rightarrow ee\nu\nu]$$

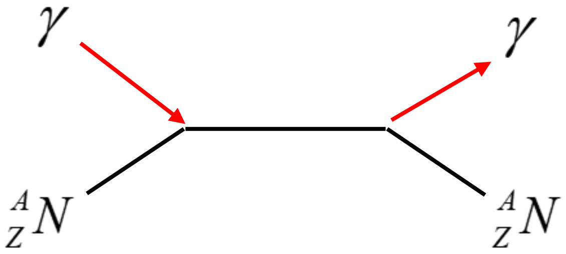
3.1 BH vs. VCS

$$\gamma + N \rightarrow N + e^{+} + e^{-} \ \ +(\bar{\nu}+\nu)$$





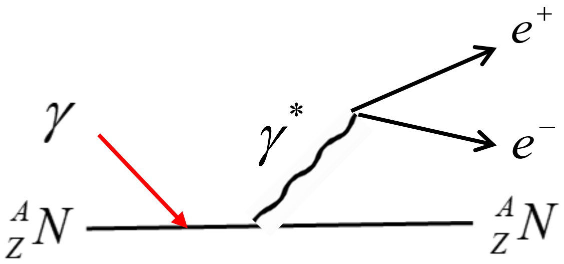
(A) Compton Scattering



dominant for $E_\gamma < 2m_e$

(B) Virtual Compton Scattering

: factorizable, $\propto \alpha \times (Z_N)^2$

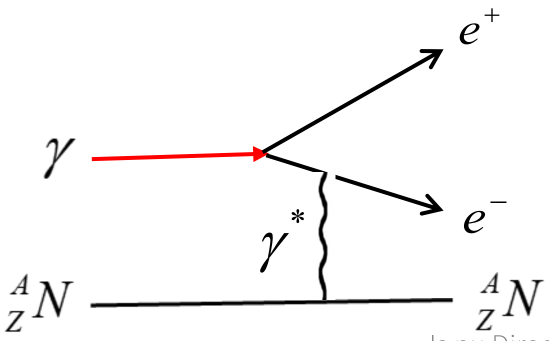


dominant for $E_\gamma \geq 2m_e$

(just above threshold $\propto 1/q^2$)

(C) Bethe-Heitler

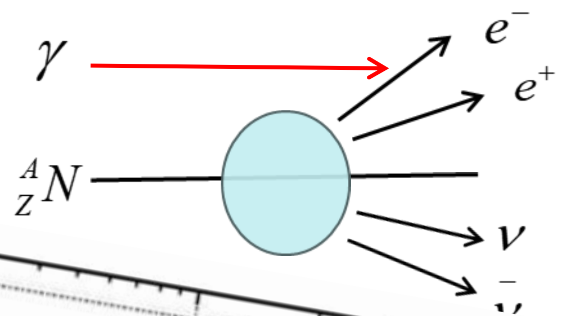
: non-factorizable, $\propto \alpha$

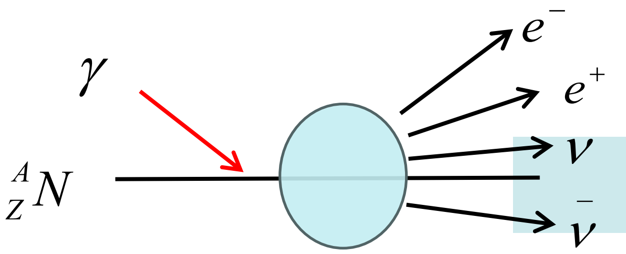


dominant for $E_\gamma >> 2m_e$

$E_\gamma > 7\text{MeV}, \text{angle}(e^+, e^-) \sim \text{large}$

3.1 BH vs. VCS





γ - ... $+(\bar{\nu}+\nu)$

dominant for $E_\gamma \geq 2m_e$

(just above threshold $\propto 1/q^2$)

...t for $E_\gamma >> 2m_e$

(c)

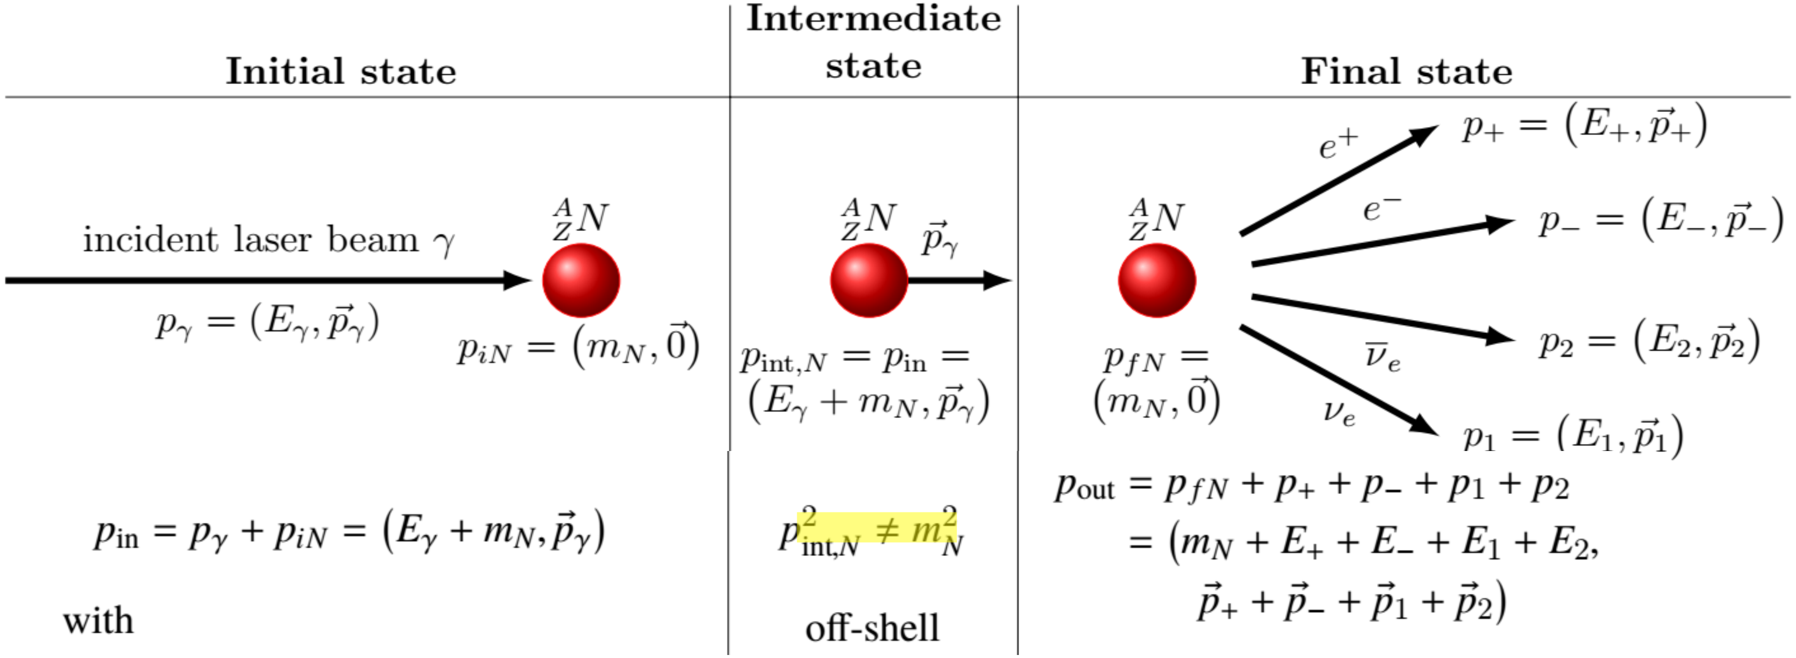
: non-factorizable, $\propto \alpha$ ... eV, angle$(e^+, e^-) \sim$ large

$^A_Z N$

4. Does the final N move as of recoil motion ?

$$\gamma + {}^A_Z N \to {}^A_Z N \to {}^A_Z N + e^- + e^+ + (\bar{\nu} + \nu)$$

Lab - frame



Source of Virtuality

Virtuality comes in to produce massive particles

$$p_\gamma(\text{incoming})^2 = 0 \qquad p_{\gamma^*}(\to ee\nu\nu)^2 \succ 2m_e^2 \neq 0$$

Does the final N move as of recoil motion ?

$$\gamma + {}^A_Z N \rightarrow {}^A_Z N \rightarrow {}^A_Z N + e^- + e^+ + (\bar{\nu} + \nu)$$

Is the FINAL STATE N (in crystal) at rest or moving (after collision with photon) ??

With e.g. $E_\gamma = 3\text{MeV},\ m(N) \sim 70\text{GeV}$, colliding photon CANNOT break NOR dislocate N, instead N oscillate !!

Time averaged VELOCITY $\langle \vec{V} \rangle = 0$, however ENERGY $\langle V^2 \rangle \neq 0$ ➔

(a) the final N at rest and energetic to produce MASSIVE particles !!
(b) the final N gives the recoil energy to the produced final particles !!

$$E(e^+, e^-) = E_\gamma \rightarrow E(e^+, e^-) = E_\gamma + E_{\text{reciol}} = E_\gamma (1 + m_e / m_N) \approx E_\gamma$$

(c) In the experiment $\gamma + N \rightarrow N + e^+ + e^-$, never seen time-delayed energetic photon !!

(instead, target matter N would heat up via oscillation)

** N in crystal = (strong) spring interaction with neighboring N (unlike free N or N in cloud chamber detector)

C. S. Kim , D. Sahoo and G. Lopez (in progress)

Requires e+, e- from the same production point

$$E_{e+} + E_{e-} << E_\gamma - n \times \Delta E \quad (Q-\text{value constraint})$$

Distinguish e+ e- nu nu from e+ e-

SUMMARY

1) $0\nu\beta\beta$, suppressed by $|m_{\beta\beta}|^2$, can be a evidence of LNV, but not an unequivocal evidence of sub-eV active neutrino as Majorana.

2) Back-to-back $\nu - \bar{\nu}$ in $\gamma + {}^A_Z N \to {}^A_Z N + e^- + e^+ + (\bar{\nu} + \nu)$, can be an alternative to $0\nu\beta\beta$, and possibly the best way to distinguish Dirac from Majorana for sub-eV active neutrinos.

Conclusion – Final Comment

** The neutrino-less double beta decay (NDBD) has a limitation that it is dependent on the unknown tiny mass of the neutrino as well as it is not an unequivocal evidence of sub-eV active neutrino being Majorana. Our proposals are very interesting viable alternatives to NDBD as far as probing Majorana nature of sub-eV active neutrinos is concerned.

" ……. urgent to explore whether there are any SM allowed processes and kinematic observables that can directly probe the Majorana nature of neutrinos avoiding this pDMCT constraint, instead of using 0nuBB or LNV. "

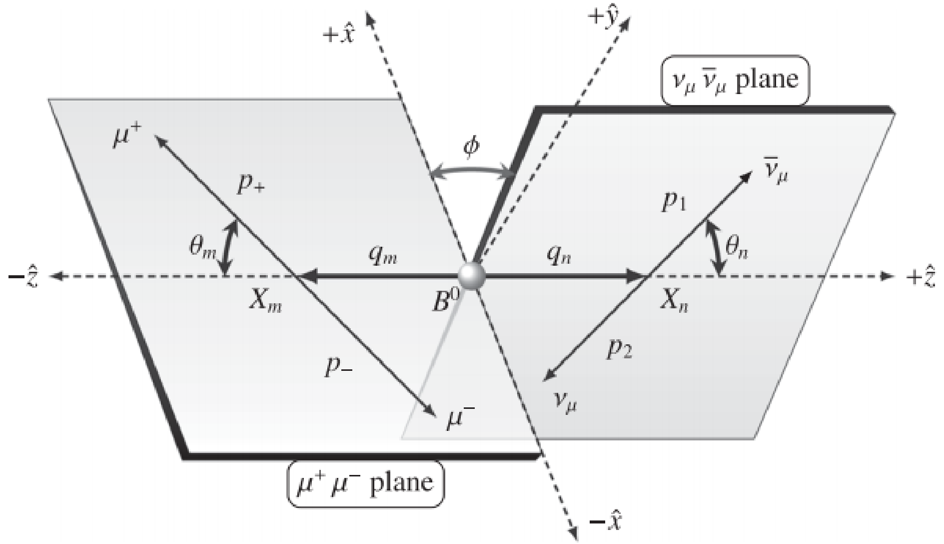
1. Comments on "On the Dirac-Majorana neutrinos distinction in four-body decays" (arXiv:2305.14140)

[CS Kim et.al, arXiv:2308.08464]

On angle ϕ :



$$B^0 \to \mu^-(p_-)\,\mu^+(p_+)\,\overline{\nu}_\mu(p_1)\,\nu_\mu(p_2)$$

$$\frac{d^5\Gamma^{D/M}}{dm_{\mu\mu}^2 dm_{\nu\nu}^2 d\cos\theta_m d\cos\theta_n d\phi} = \frac{Y Y_m Y_n \langle |\mathcal{M}^{D/M}|^2 \rangle}{(4\pi)^6 m_B^2 m_{\mu\mu} m_{\nu\nu}},$$

1) With Back-to-back muons (& neutrinos)

$$\vec{p}_+ + \vec{p}_- = \vec{0} = \vec{p}_1 + \vec{p}_2$$

two straight lines, $\vec{p}_+ + \vec{p}_-$ and $\vec{p}_1 + \vec{p}_2$ meet at one point, making one plane,

$$\phi = 0$$

2) Back-to-back constraints give 3 constraints in phase space integral, only 2 independent variables,

$$E_\mu \quad \text{and} \quad \cos(\theta_m)$$

2. Comments on “Can quantum statistics help distinguish Dirac from Majorana neutrinos?” (arXiv:2402.05172) [CS Kim et.al, arXiv:2402.11386]

1. Decay rate of $B^0 \to \mu^-(p_-)\,\mu^+(p_+)\,\overline{\nu}_\mu(p_1)\,\nu_\mu(p_2)$ is given by

$$\Gamma^{D/M} = \frac{1}{2\,m_B}\int \left|\mathscr{M}^{D/M}(p_+, p_-, p_1, p_2)\right|^2 \mathrm{dLIPS}\ (2\pi)^4\,\delta^{(4)}\left(p_B - p_+ - p_- - p_1 - p_2\right),$$

$$\mathrm{dLIPS} = \left(\frac{\mathrm{d}^3\vec{p}_+}{(2\pi)^3\,2E_+}\right)\left(\frac{\mathrm{d}^3\vec{p}_-}{(2\pi)^3\,2E_-}\right)\left(\frac{\mathrm{d}^3\vec{p}_1}{(2\pi)^3\,2E_1}\right)\left(\frac{\mathrm{d}^3\vec{p}_2}{(2\pi)^3\,2E_2}\right),$$

$$\boxed{\text{mass dim}\left[\Gamma^{D/M}\right] = 1.}$$

Imposing b2b kinematic condition, $\vec{p}_+ + \vec{p}_- = \vec{0} = \vec{p}_1 + \vec{p}_2$, instead of following suitable variable changes and constraining them, multiplying Dirac delta function $\delta^{(3)}\ (\vec{p}_1 + \vec{p}_2)$

$$X^{D/M} = \frac{1}{2\,m_B}\int \left|\mathscr{M}^{D/M}(p_+, p_-, p_1, p_2)\right|^2 \mathrm{dLIPS}\ (2\pi)^4\,\delta^{(4)}\left(p_B - p_+ - p_- - p_1 - p_2\right)\delta^{(3)}\ (\vec{p}_1 + \vec{p}_2)$$

neglecting m_mu, m_nu

$$X^{D/M} \approx \frac{1}{32\,(2\pi)^6\,m_B}\int \left|\mathscr{M}^{D/M}\underbrace{(p_+, p_-,}_{\vec{p}_-=-\vec{p}_+}\underbrace{p_1, p_2)}_{\vec{p}_2=-\vec{p}_1}\right|^2 \mathrm{d}E_\mu\,\mathrm{d}\cos\theta,$$

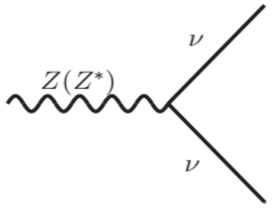
$$\boxed{\text{mass dim}\left[X^{D/M}\right] = -2,}$$ due to the fact that Dirac delta function is dimensionful quantity.

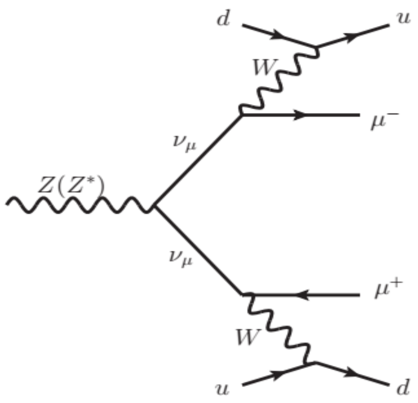
Anti−symmetrization of Amplitude ： F−D Statistics

** Should the amplitude be anti-symmetrized for pair of Majorana neutrinos of the same flavor ??

1) Quantum statistics requires absolutely identical indistinguishable particles.

2) Quantum measurement effect is analogous to the well-known fact that **the interference pattern in a double slit experiment is destroyed if one could somehow know through which slit the photon has passed.**





➔ requires a method deducing E (or p) of neutrino without destroying quantum effects.

Need Anti-symmetrization

No Anti-symmetrization once we know $\nu_1 \neq \nu_2$ (➔ similar to the double slit experiment)

3. Comments on "Exploring Quantum Statistics for Dirac and Majorana Neutrinos using Spinor-Helicity techniques" (arXiv:2507.07180)

[CS Kim et.al, arXiv:2507.14463]

Consider $B^0(p_B) \to \mu^-(k)\mu^+(\bar{k})\bar{\nu}(p_1)\nu(p_2)$

$$\mathcal{M}^D = \mathcal{M}(p_1, p_2) \qquad \mathcal{M}^M = \frac{1}{\sqrt{2}}(\mathcal{M}(p_1, p_2) - \mathcal{M}(p_2, p_1))$$

$$\langle|\mathcal{M}^D|^2\rangle \sim (k \cdot p_1)(\bar{k} \cdot p_2)$$

However, arXiv:2507.07180 added a term by hand to symmetrize

$$\langle|\mathcal{M}^D|^2\rangle \sim (k \cdot p_1)(\bar{k} \cdot p_2) \boxed{+ (k \cdot p_2)(k \cdot p_1)}$$

$W^+ \to \ell^+\bar{\nu}_\ell$ $(\Delta L = -2)$ and $W^- \to \ell^-\nu_\ell$ $(\Delta L = +2)$

$$\langle|\mathcal{M}^M|^2\rangle \sim (\bar{k} \cdot p_1)(k \cdot p_2) + (\bar{k} \cdot p_2)(k \cdot p_1) + \text{(interference terms)}$$

- 1. There is no fundamental principle or law of physics which requires that the amplitude square for a process having two distinguishable particles in the final state ought to be symmetrized with respect to the exchange of the 4-momenta of the concerned particles, when the two particles are not detected in the detector
- 2. In the standard model (SM) the Dirac neutrino and antineutrino carry lepton numbers; $W^+ \to \ell^+\nu_\ell$ and $W^- \to \ell^-\bar{\nu}_\ell$ for $\ell = e, \mu, \tau$, to ensure lepton number conservation
- 3. For Majorana neutrinos, for which ν = ν and the lepton number is not a good quantum number.
