Gauge-Higgs Unification models: a reappraisal

G. Cacciapaglia

30/08/2017 @ CTPU Daejeon
The ideal world:

I need to write a paper tonight!

Alas! My model is ruled out!

The wise experimentalist
The real world:

Struggling to put together a model in the midst of "buzzers"!

- Flavour!
- Higgs couplings!
- EWPTs!
- No DM!
- Top couplings!
- No bumps!
- Higgs mass!
What is our job?

- Models can be ruled out, but cannot be proven right!
What is our job?

- Models can be ruled out, but cannot be proven right!

Class A:
Parameter space connected to the SM prediction
Cannot be ruled out!
What is our job?

Models can be ruled out, but cannot be proven right!

Class B:
Parameter space disconnected from SM prediction
Can be ruled out!
What is our job?

- Models can be ruled out, but cannot be proven right!

Grey zone:
- Fine tuning?
- Personal taste?
- How close to the decoupling limit?
What is our job?

- Models can be ruled out, but cannot be proven right!

BSM dream:

The SM itself can be excluded!

Are we there yet? No...
What do we know about the Higgs?

- The mass has been precisely measured!
- The couplings follow the SM expectations: being proportional to mass.
- The uncertainties are still large!
- Coupling measurements are always subject to model assumptions!!!
What do we know about the Higgs?

- Theoretical Modelling, i.e. the Standard Model Higgs

\[
\mathcal{L}_{\text{Higgs}} = (D_{\mu} \phi)^\dagger (D^{\mu} \phi) + \mu^2 \phi^\dagger \phi - \lambda (\phi^\dagger \phi)^2
\]

"wrong sign"

\[
\tau^i = \frac{\sigma^i}{2}
\]

Pauli matrices

\[
\phi = e^{i \pi^i \tau^i} \cdot \begin{pmatrix} 0 \\ \nu + \frac{h}{\sqrt{2}} \end{pmatrix}
\]

\[
\nu = \frac{\mu}{\sqrt{2\lambda}} \sim 246 \text{ GeV}
\]

It well describes the symmetry breaking, but no dynamical insight!
Do we still need BSM?

We have a pretty good idea of the mechanism.

But, we don't know how to protect it:

\[ \delta m_{h}^2 \sim \frac{g^2}{16\pi^2} M_{NPh}^2 \]

Having measured a light Higgs brings the naturalness problems to the real world!
A natural Higgs = a special type of scalars!

Supersymmetry:

All scalars are special, associated to a fermion by a space-time symmetry!

Scalar <-> Fermion

\[ \delta m_h^2 \sim \frac{g^2}{16\pi^2} M_{\text{SUSY}}^2 \log \frac{\Lambda}{M_{\text{SUSY}}} \]
A natural Higgs = a special type of scalars!

Compositeness:

Special scalars are bound states of more fundamental fermions!

$$\phi \sim \langle \psi \psi \rangle$$

$$\delta m_h^2 \sim \Lambda_{TC}^2$$

$$\Lambda_{TC} \sim 4\pi v_{SM} \sim 3 \text{ TeV}$$
A natural Higgs = a special type of scalars!

Goldstones:

Goldstone bosons are special massless scalars. Masses generated by symmetry breaking spurions.

Usually in association with compositeness:

\[ V(h)^\text{tree} = 0 \]

No potential allowed at tree level!

\[ \phi \sim \langle \psi \psi \rangle \]

\[ \delta m_h^2 \sim \frac{g^2}{16\pi^2} \Lambda_{TC}^2 \sim v_{SM}^2 \]
A natural Higgs = a special type of scalars!

Scalars as gauge bosons:

In extra dimensions, the extra polarisations of gauge bosons are special 4D scalars!

\[ \phi \sim A_5, \ A_6, \ldots A_D \]

\[ V(h)^{\text{tree}} = 0 \]

\[ \delta m_h^2 \sim \frac{g^2}{16\pi^2} \frac{1}{R^2} \]

No potential allowed at tree level!
Think of an additional space dimension, wrapped on itself.

Extra dimensions for dummies

- XD fields $\rightarrow$ tower of KK states
- frequencies $\rightarrow$ KK masses
- geometry $\rightarrow$ KK parities

For us, 4D beings, the 5D fields appear as massive 4D fields!
Extra dimensions for dummies

\[ \phi(x^\mu, y) \]

Periodicity condition:
\[ \phi(x^\mu, 2\pi R) = \phi(x^\mu, 0) \]

Fourier expansion:
\[ \phi(x^\mu, y) = \sum_{n \in \mathbb{Z}} \tilde{\phi}_n(x^\mu) e^{in/Ry} \]

\[ [\partial_\mu \partial^\mu - \partial_y^2] \phi(x^\mu, y) = \sum_{n \in \mathbb{Z}} e^{in/Ry} [\partial_\mu \partial^\mu - \frac{n^2}{R^2}] \tilde{\phi}_n(x^\mu) = 0 \]

5D EOM

4D EOM
Extra dimensions for dummies

Geometric parity can be imposed: orbifold projection

\[ \phi(x^\mu, -y) = \pm \phi(x^\mu, y) \]

\[ \phi(x^\mu, y) = \sum_{n=0}^{\infty} \cos \left( \frac{n}{R} y \right) \phi_n^+ + \sum_{n=1}^{\infty} \sin \left( \frac{n}{R} y \right) \phi_n^- \]

Parity even.
Includes massless \( n=0 \) mode!

Parity odd.
XD gauge fields

\[ A_M = (A_\mu, A_5) \]

Vector

Scalar

\[ S = \int d^4 x \int_0^{2\pi R} dy - \frac{1}{4g_5^2} F_{MN} F^{MN} \]

\[ \frac{2\pi R}{g_5^2} = \frac{1}{g^2} \]

For the zero mode

A generic loop factor will thus grow with the energy.

Using Naive dimensional analysis:

\[ \frac{g_5^2}{16\pi^2} \Lambda \sim 1 \Rightarrow \Lambda \sim \frac{8\pi}{g^2} \frac{1}{R} \]
An XD Higgs mechanism

\[ F_{MN} F^{MN} = F_{\mu\nu} F^{\mu\nu} - 2 F_{5\mu} F^{5\mu} \]

\[ = F_{\mu\nu} F^{\mu\nu} - 2(\partial_5 A_\mu)^2 - 2(\partial_\mu A_5) + 4(\partial_5 A_\mu)(\partial^\mu A_5) \]

A mixing between (massive) vectors and scalars is present!

In the orbifold projection vector and scalar have opposite parities.

\[ A^+_M = (A^+_\mu, A^+_5) \]

\[ A^-_M = (A^-_\mu, A^+_5) \]
An XD Higgs mechanism

\[ A^+_M = (A^+_\mu, A^-_5) \]

\[ A^-_M = (A^-_\mu, A^+_5) \]

Massive vectors!
An XD Higgs mechanism

\[ F_{MN}F^{MN} = F_{\mu\nu}F^{\mu\nu} - 2F_{5\mu}F^{5\mu} \]

\[ = F_{\mu\nu}F^{\mu\nu} - 2(\partial_5 A_\mu)^2 - 2(\partial_\mu A_5)^2 + 4(\partial_5 A_\mu)(\partial^\mu A_5) \]

A mixing between (massive) vectors and scalars is present!

In the orbifold projection vector and scalar have opposite parities,

\[ A_+^M = (A_\mu^+, A_5^-) \quad \text{Massless vector + massive vectors} \]

\[ A_-^M = (A_\mu^-, A_5^+) \quad \text{Massless scalar + massive vectors} \]
XD gauge theories have a built-in Higgs mechanism via special scalars!

Gauge symmetries can be broken by orbifold projection (parity assignments)
An $\text{SU}(3)$ toy model

\[ A_M(-y) = P \cdot A_M(y) \cdot P \]

\[
P = \begin{pmatrix}
-1 & -1 \\
0 & 1
\end{pmatrix}
\]

\[
A^+_M : \begin{pmatrix}
\frac{1}{2} W_3 & \frac{1}{\sqrt{2}} W^+ & 0 \\
\frac{1}{\sqrt{2}} W^- & -\frac{1}{2} W_3 & 0 \\
0 & 0 & 0
\end{pmatrix}
\]

\[
\text{SU}(2)
\]

\[
A^-_M : \frac{1}{\sqrt{2}} \begin{pmatrix}
0 & 0 & H^+ \\
0 & 0 & H_0 \\
H^- & H_0^* & 0
\end{pmatrix}
\]

\[
\text{U}(1)
\]
An SU(3) toy model

\[
\frac{1}{\sqrt{2}} \begin{pmatrix}
0 & 0 & H^+ \\
0 & 0 & H_0 \\
H^- & H_0^* & 0
\end{pmatrix}
\]

Can we identify this with the Higgs doublet?

U(1) charge:

\[
\frac{1}{2\sqrt{3}} (1 - (-2)) = \frac{\sqrt{3}}{2}
\]

\[g' = \sqrt{3}g \Rightarrow \sin^2 \theta_W = \frac{3}{4}\]

Does not match the SM value!
An SU(3) toy model

\[
\frac{1}{\sqrt{2}} \begin{pmatrix} 0 & 0 & H^+ \\ 0 & 0 & H_0 \\ H^- & H_0^* & 0 \end{pmatrix}
\]

Can we identify this with the Higgs doublet?

Easy solution: add a bulk U(1)x gauge symmetry and tune the gx coupling.

\[
\frac{1}{2} g' = \frac{\sqrt{3}}{2} g + \frac{1}{2} g_x
\]

Antoniadis, Benakli, Quiros hep-th/0108005
The Hosotani mechanism

The Higgs VEV can be geometrised!

EWSB induced by giving a VEV to the Higgs, which is a gauge boson.

The VEV can be removed by a suitable gauge transformation:

\[ \Omega(y) = e^{i\alpha} T_H \frac{y}{R} \]

\[ H_0 \rightarrow H_0 - \partial_y \left( \alpha \frac{y}{R} \right) = H_0 - \frac{\alpha}{R} \]

The periodicity condition is also affected:

\[ \Omega(0)\phi(0) = \Omega(2\pi R)\phi(2\pi R) \]
\[ \phi(0) = e^{i2\pi \alpha} T_H \phi(2\pi R) \]
\[ \phi = \sum_n \tilde{\phi} e^{i(n+\alpha)y/R} \]

Hosotani 1983
The Hosotani mechanism

The Higgs VEV can be geometrised!

\[ \phi(0) = e^{i2\pi \alpha} T_H \phi(2\pi R) \]

\[ m_n = \frac{|n + \alpha|}{R} \]

\[ m_0 = \frac{\alpha}{R} \]

\[ \phi = \sum_n \tilde{\phi} e^{i(n+\alpha)y/R} \]

The spectrum is shifted.

Zero modes pick up a mass!
How about fermions?

\[
\frac{1}{\sqrt{2}} \begin{pmatrix} 0 & 0 & H^+ \\ 0 & 0 & H_0 \\ H^- & H_0^* & 0 \end{pmatrix}
\]

We can identify this with the Higgs doublet!

Consider a fundamental of SU(3):

\[
\psi = \begin{pmatrix} \psi_D \\ \psi_S \end{pmatrix}
\]

\[
\text{U(1) charges: } \begin{pmatrix} 1/6 \\ -1/3 \end{pmatrix}
\]

\[
\overline{\psi} D_5 \gamma^5 \psi \Rightarrow \frac{g}{\sqrt{2}} \overline{\psi}_D H \psi_S + h.c.
\]

\[
y_f = \frac{g}{\sqrt{2}}
\]

Yukawa couplings are related to gauge couplings!
The SU(3) model fails!

- Incorrect prediction of the Weinberg angle:
  \[ \sin^2 \theta_W = \frac{3}{4} \]

- Yukawas related to the gauge couplings:
  \[ m_f = m_W \]

It is easy to reduce the fermion masses by use of localisation, but hard to enhance.

The value of the top mass is a serious issue!

Many solutions attempted:

- Looking for other gauge groups: G2, ...
- Embedding the top in higher representations.  
  Csaki, Grojean, Murayama hep-ph/0210133
- Adding localised couplings/fields.

Geometry at work

In flat space, gauge zero modes are constant:
Geometry at work

In flat space, gauge zero modes are constant:

\[ \int dy \, H \bar{\psi} \psi = H \int dy \, \bar{\psi} \psi \]
Geometry at work

In warped space, gauge-scalar zero modes are NOT constant:

The overlap integral can give enhancement factors!
Geometry at work

In warped space, gauge-scalar zero modes are NOT constant:

\[ ds^2 = \left( \frac{R}{z} \right)^2 (dx^2 - dz^2) \]

Conformal invariant if \[ x \rightarrow \epsilon x \quad z \rightarrow \epsilon z \]

Randall, Sundrum hep-ph/9905221

The AdS/CFT duality (conjectured for supersymmetric models) suggests that the XD model may share the same features of (composite) conformal 4D models!

This observation lead to a revival of composite Higgs models.
One fact has been overlooked so far: couplings run!

The Unified predictions are valid at this scale.

They need to be matched at the EW scale!

Even though the two scales may not be that far, XD features accelerated running!
One fact has been overlooked so far: couplings run!

The collective effect of the resonances produces a fast linear running vs. the 4D log one!

At each threshold, new states enter the running.

This fact is well known for the gauge couplings (see XD GUT models).

But, the Yukawas are also gauge couplings!
We reconsidered the simple SU(3) model

Rescaled couplings:

\[ \{g_1, g_2, g_3, g_t\} = \left\{ \frac{g'}{\sqrt{3}}, g, g_s, \sqrt{2} y_t \right\}. \]

We reconsidered the simple SU(3) model

4D running

SU(2) and U(1) Unify

First KK threshold
We reconsidered the simple SU(3) model

Value of the couplings at Unification:

\[ g_2 \sim 0.1 \]

No. of KK modes below Unification.

\[ n_{KK} \sim m_Z R e^{10} \sim 400 \]

NDA cut-off:

\[ \Lambda R \sim \frac{8\pi}{g_2^{2}} \sim 2000 \]
We reconsidered the simple SU(3) model

Value of the couplings at Unification:

\[ g_2 \sim 0.1 \]

“top” Yukawa at the EW scale:

\[ y_t \sim 0.6 \]
Running of the gauge couplings:

\[ 16\pi^2 \frac{dg_i}{dt} = b_i^{SM} g_i^3 + (S(t) - 1) b_i^{GHU} g_i^3, \]

\[ g_i = \{ g', g, g_s \} \]

Encodes linear 5D running:

Contribution of KK modes:

\[ b_i^{SM} = \left[ \frac{41}{6}, -\frac{19}{6}, -7 \right] \]

\[ b_i^{GHU} = \left[ -\frac{17}{6}, -\frac{17}{2}, -\frac{17}{2} \right] \]

\[ S(t) = \begin{cases} \mu R = M_Z R e^t & \text{for } \mu > 1/R, \\ 1 & \text{for } M_Z < \mu < 1/R, \end{cases} \]

Check: same for all couplings!
Running of the Yukawa:

Complication: it depends on other couplings.

We simplify by assuming that couplings of the KK modes follow the running of the gauge/Yukawa couplings

\[
16\pi^2 \frac{d y_t}{d t} = \beta_t^{SM} + \left( S(t) - 1 \right) \beta_t^{GHU},
\]

\[
\beta_t = y_t \left[ c_t y_t^2 + \sum_i d_i g_i^2 \right]
\]
Running of the Yukawa:

\[ \beta_t = y_t \left[ c_t y_t^2 + \sum_i d_i g_i^2 \right] \]

Numerical values:

\[ c_{t}^{SM} = \frac{9}{2} \]

\[ d_{i}^{SM} = \left[ -\frac{5}{12}, -\frac{9}{4}, -8 \right] \]

\[ c_{t}^{GHU} = \frac{21}{2} \]

\[ d_{i}^{GHU} = \left[ -\frac{35}{24}, -\frac{39}{8}, -4 \right] \]
Running of the Yukawa:

\[ \beta_t = y_t \left[ c_t \, y_t^2 + \sum_i d_i \, g_i^2 \right] \]

\[ c_t^{\text{GHU}} = \frac{21}{2}, \quad d_i^{\text{GHU}} = \begin{pmatrix} -\frac{35}{24} \\ -\frac{39}{8} \\ -4 \end{pmatrix} \]

Imposing the Unification relations

\[ g' = \sqrt{3} \, g, \quad y_t = \frac{g}{\sqrt{2}} \]

\[ \beta_t = \left( -4 \, g^2 - 4 \, g_s^2 \right) \frac{g}{\sqrt{2}} \]
Conclusions

- Gauge-Higgs Unification models have been prematurely abandoned

- Running of the gauge and Yukawa couplings needed to properly match the theory to the EW scale!

- We show in a SU(3) toy model that the tree level tensions can be softened by the running!

- More work needs to be done towards a realistic model: Higgs mass?
