# Dark Matter (DM)

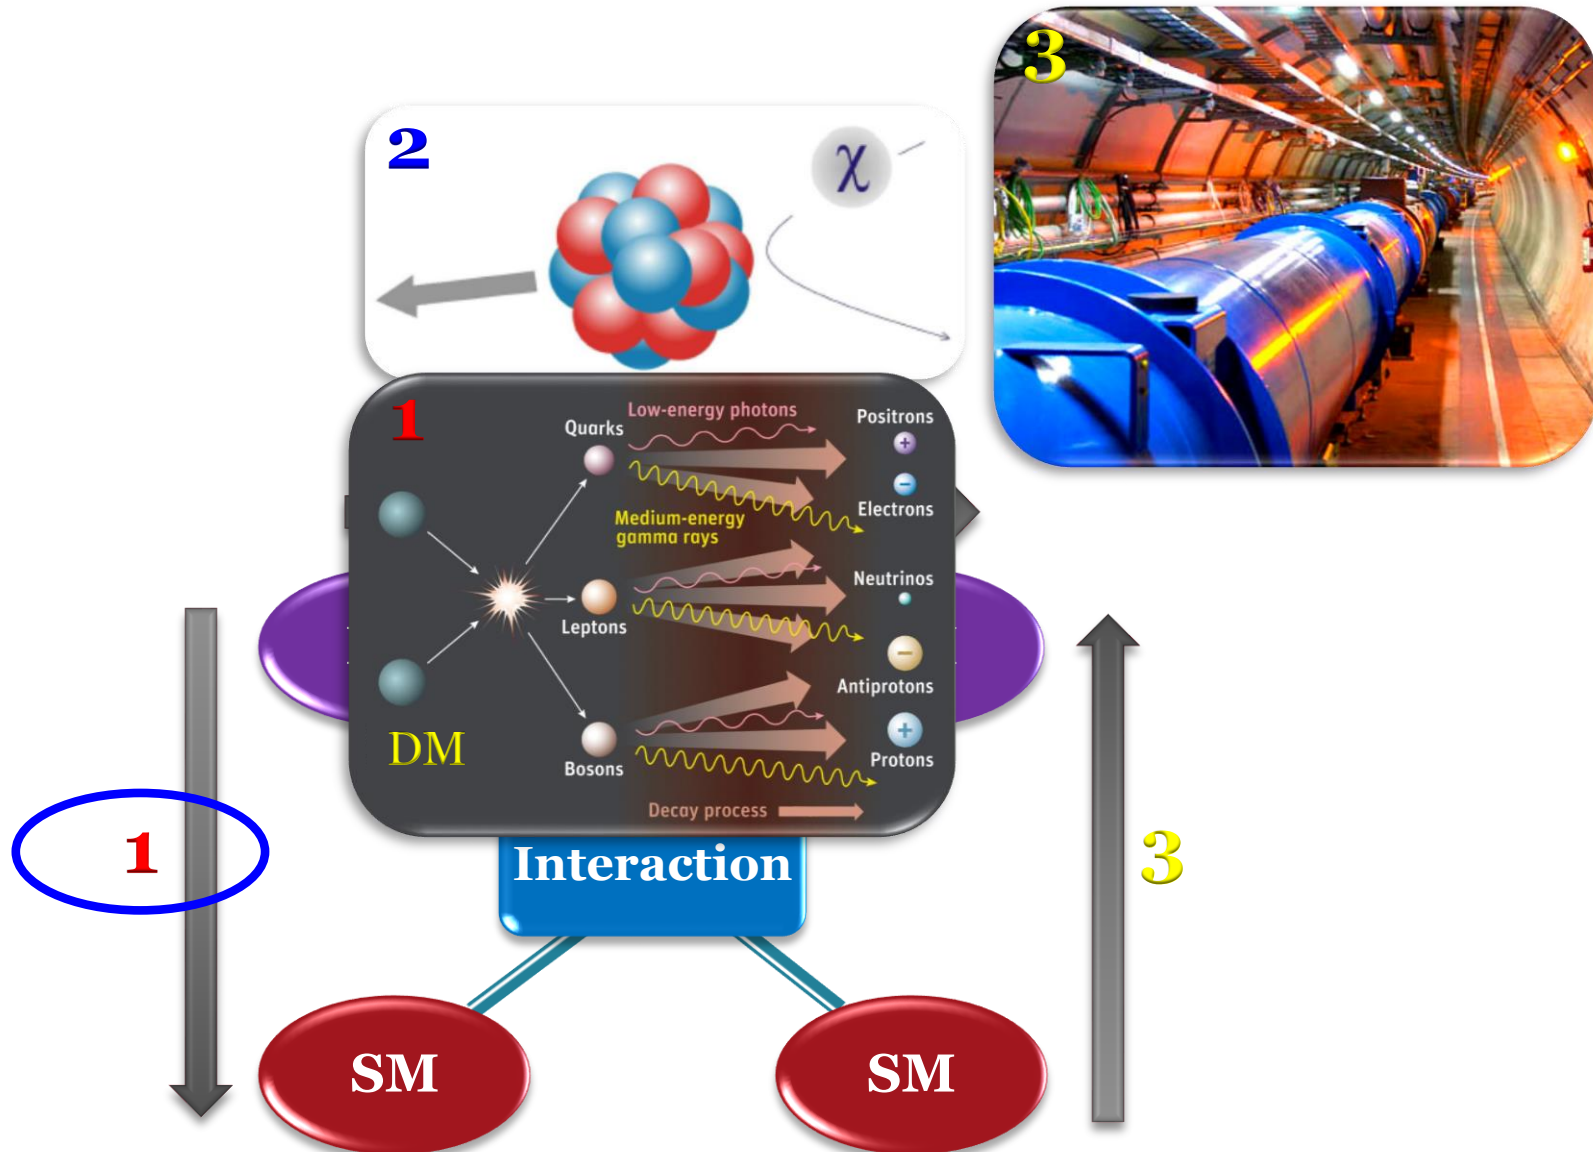

- ❖ **DM**: ~25% of our Universe
- ❖ **Compelling paradigm**:  
massive, non-luminous & stable particles
- ❖ **Evidence**
  - ✓ Galaxy rotation curve
  - ✓ Bullet cluster
  - ✓ Gravitational lensing
  - ✓ Structure formation
  - ✓ CMB
  - ✓ Coma Cluster
  - ✓ Sky surveys
  - ✓ ...

# DM Search Strategies

# DM Indirect Detection

# Indirect Detection: Cosmic-rays

# Hints from Cosmic-ray?

## ❖ DM signatures in cosmic-ray observations?

- SPI/INTEGRAL ( $\gamma \rightarrow e^+$ )
- PAMELA ( $e^\pm, p^\pm, \dots$ )
- ATIC ( $e^-e^+$ )
- Fermi-LAT ( $\gamma$ )
- AMS-02 ( $e^\pm, p^\pm, \dots$ )
- XMM-Newton (X-ray)
- IceCube ( $\nu$ )
- ...

# Importance of $\gamma$ -rays

- Preserve spatial information about their sources  
& travel long distance (vs.  $e^\pm$ ,  $p^\pm$ , ...)
- Spectrum at the detector similar to the injection spectrum
- Photons can be measured very easily & precisely (vs.  $\nu$ 's)
- Relatively efficient S/B discrimination in searches for  $\gamma$ -ray signatures
- Signatures in  $E_\gamma$  play a major role in DM searches.

(monochromatic peak and/or continuous bump signals)

# Peaks: 130 GeV/3.5 keV Lines

❖  $\gamma$  line (Gaussian peak)

at  $E_\gamma \approx 130$  GeV/3.5 keV

→ DM: **directly** annihilate/decay into **photon + X**

Alternative mechanism for cosmic-ray peaks based on **extended DM**:

[Doojin Kim & JCP \[1508.06640\]](#)

# GeV $\gamma$ -rays from Galactic Center

See Simona Murgia's Talk

Hot Topic of  
the season!

Before

After

# Bump: GC GeV Excess

See Simona Murgia's Talk

- ❖ **Signal: extended to  $> 10^\circ$  from the GC**
- ❖ Consistent with the **dynamical center** of the **Milky Way** ( **$< 0.05^\circ$** )
- ❖ The spectrum of the excess **peaks at 1-3 GeV**.

# Bump: Preferred Final States

DM coupling to SM induces  $\gamma$  interactions.

Parton shower & hadronization

- ❖ The spectrum is in **good agreement** with the predictions from **20-40 GeV** **DM mostly annihilating to quarks** (fragmentation, IC, bremsstrahlung, ...).
- ❖ Required cross section is  $\sim 0.7\text{-}2.1 \cdot 10^{-26} \text{ cm}^3/\text{s}$

# DM Models for GeV Excess

- ❖ **GeV excess** & **direct detection signals**: B. Kjae & **JCP** (1310.2284)  $m \sim 10 \text{ GeV}$
- ❖ **Higgs portal DM**: N. Okata & O. Seto (1310.5991:  $bb$  or  $\tau\tau$ , 1404.1373:  $bb$ ), ...
- ❖ **Flavored DM**: C. Boehm et al. (1401.6458), P. Agrawal, B. Batell, D. Hooper & T. Lin (1404.1373), ...
- ❖ **Effective Ops.**: W. Huang, A. Urbano & W. Xue (1310.7609), A. Alves, S. Profumo, F. Queiroz & W. Shepherd (1403.5027), A. Berlin, D. Hooper & S. McDermott (1404.0022), E. Izaguirre, G. Krnjaic & B. Shuve (1404.2018), ...  
“Slight variation of the typical mechanism: directly into SM  $f$ 's”
- ❖ **On-shell mediator**: C. Boehm, M. Dolan & C. McCabe (1404.4977), P. Ko, W. Park & Y. Tang (1404.5257), Tim Tait et al. (1404.6528), A. Martin, J. Shelton & J. Unwin (1405.0272), ...
- ❖ **Model-independent constraints**: KC. Kong & **JCP** (1404.3741)

# DM Models for GeV Excess

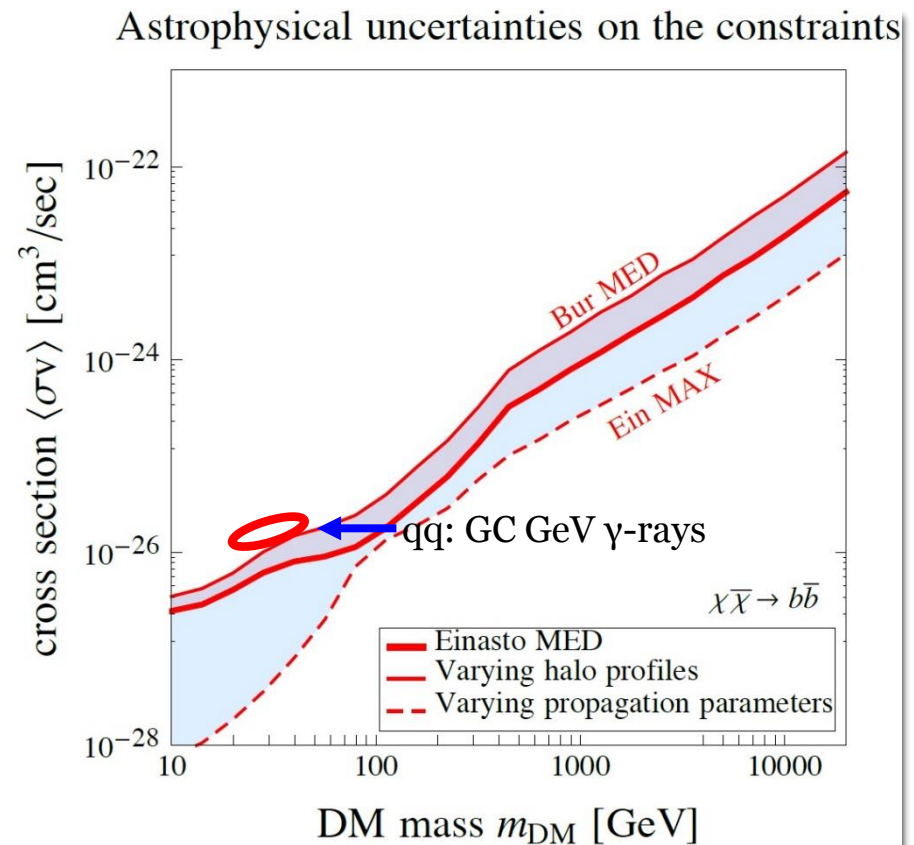

- ❖ **GeV excess** & **direct detection signals**: B. Kjae & **JCP** (1310.2284)  $m \sim 10 \text{ GeV}$
- ❖ **Higgs portal DM**: N. Okata & O. Seto (1310.5991:  $bb$  or  $\tau\tau$ , 1404.1373:  $bb$ ), ...

- ❖ **Model-independent constraints**: KC. Kong & **JCP** (1404.3741)

DM couplings to **1<sup>st</sup>** (**2<sup>nd</sup>**) **generation** of SM  $f$ 's: **disfavored!** (Maybe even not  $b$ -quark)

# New Limits from AMS-02

Cirelli et al., arXiv:1504.04276

- ❖ Based on the recent AMS-02 anti-p/p data
- ❖ **q-final states are disfavored!** (regardless of mediator)

**No Other  
Possibility?**

# Energy Peak in Cosmic $\gamma$ -rays

❖ With DM interpretation in mind, we propose **alternative mechanisms** based on the observation of the “**energy-peak**” in **collider physics** to explain the GC GeV  $\gamma$ -ray excess.

❖ Why energy peak?

✓ **Energy** is the **only** available quantity

(vs. large multiplicity, momentum w.r.t. the beam line in collider events)

✓ **Unique spectral features** irrespective of underlying DM model details

(vs. highly model-dependent in the standard interpretation)

# *E*-Peak: a Quick Review I

arXiv: 1209.0772

## ● Two-body decay kinematics

A simple 2-body decay of a heavy resonance  $B$  into  $A$  and massless visible  $a$

**Rest frame of  
particle  $B$**

- Energy of visible particle  $a$  is **monochromatic** & **simple** function of masses
- $E^*$  measured &  $m_A$  known,  $\rightarrow m_B$  determined, vice versa
- Great to be on the **special frame**!

# *E*-Peak: a Quick Review II

arXiv: 1209.0772

## ● Two-body decay kinematics

A simple 2-body decay of a heavy resonance  $B$  into  $A$  and massless visible  $a$

### Laboratory frame

- Energy of particle  $a$  should be Lorentz-transformed!

$$\underline{E = E^* \gamma (1 + \beta \cos \theta^*) = E^* (\gamma + \sqrt{\gamma^2 - 1} \cos \theta^*)}$$

- No more  $\delta$ -function-like spectrum, but a function of  $\gamma$ ,  $\theta^*$   
→ becoming a distribution due to variation in them

Peak “Invariant”

# *E*-Peak: a Quick Review III

arXiv: 1209.0772

## ● “stacking up” rectangles

- For any given Lorentz factor  $\gamma$ ,

- Distribution in  $E \rightarrow$  summing up the contributions from all relevant boost factors  
 $\rightarrow$  “**Stacking up**” rectangles weighted by boost distribution  $g(\gamma)$  (Lebesgue-type integral)
- Energy distribution has a unique **peak** at  $E=E^*$

- Details of the boost distribution  
(production mechanism, mother masses, ...) **NOT** matter

GC GeV Excess

# Continuum $E$ Spectrum

## ● DM model under consideration

- ❑ Simplest and conventional model
- ❑ Featured by a sharp peak

# Continuum $E$ Spectrum

## ● DM model under consideration

- ❑ Introducing on-shell mediator state
- ❑ Featured by a box-like distribution

# Continuum $E$ Spectrum

## ● DM model under consideration

- ❑ Introducing an **on-shell intermediate** state before the state decaying into two photons
- ❑ Developing a **plateau** or a **peak** depending on model details
- ❑ Morphologically constrained: **analytic expression** for the shape available
- ❑ Doojin Kim & **JCP** [arXiv:1508.06640]
  - **Cosmic-ray peaks**: e.g. 130 GeV/3.5 keV lines

# Continuum $E$ Spectrum

## ● DM model under consideration

- ❑ Introducing **one more on-shell intermediate** state before the state decaying into two photons
- ❑ Developing a **smoothly rising-and-falling shape**
- ❑ Generic distribution function:

$$f(E_\gamma) \propto \exp\left[-\frac{w}{2} \left(\frac{E_\gamma}{E_\gamma^*} + \frac{E_\gamma^*}{E_\gamma}\right)^p\right]$$

# Dark Cascade $\rightarrow$ $\gamma$ -ray Bump!

➤ More-than-one step cascade decay!

# Multi-DM Set-up: Assisted FO

- ❖ Two species of DM:  $\chi_h, \chi_l$  with  $m_h > m_l$  (e.g.  $U(1)' \otimes U(1)''$ ,  $Z_2' \otimes Z_2''$ )
- ❖  $\chi_h$ : dominant DM component, no direct coupling to the SM  
→ Assisted Freeze-Out
- ❖  $\chi_l$ : sub-dominant, direct coupling to the SM (  $\mathcal{L} \supset -\frac{1}{2} \sin \epsilon X_{\mu\nu} F^{\mu\nu}$  )

**Assisted Freeze-Out**

Genevieve Belanger & JCP  
(arXiv:1112.4491)

# Fit to the GeV $\gamma$ -ray excess I

- Fitting function:  $f_M(E_\gamma) = N \exp \left[ -\frac{w}{2} \left( \frac{E_\gamma}{E_\gamma^*} + \frac{E_\gamma^*}{E_\gamma} \right)^p \right]$  with  $E_\gamma^* = m_a/2$
- cf. arXiv:1402.6703  $\rightarrow \chi^2/\text{d.o.f.} = 64/20$  with  $m_{\text{DM}} = 43.0 \text{ GeV}$

# Fit to the GeV $\gamma$ -ray excess II

- Fitting function:  $f_M(E_\gamma) = N \exp \left[ -\frac{w}{2} \left( \frac{E_\gamma}{E_\gamma^*} + \frac{E_\gamma^*}{E_\gamma} \right)^p \right]$  with  $E_\gamma^* = m_a/2$
- cf. arXiv:1402.6703  $\rightarrow \chi^2/\text{d.o.f.} = 44/20$  with  $m_{\text{DM}} = 36.6 \text{ GeV}$

# Conclusion

➤ Conventional interpretations on excess in cosmic  $\gamma$ -ray measurements:

1. **Peak**: directly into  $\gamma + X$
2. **Bump**: into SM particle pairs  $\rightarrow \gamma$ 's

➤ A novel mechanism enabling us to have a “**continuum bump**”:

Dark sector w/ multi-DM's (at least **two**, e.g., Assisted FO)

$\chi_h$  finally into  $\chi_l + a(\rightarrow 2\gamma)$ , **via > 1 step cascade**

➤ Fermi-LAT data  $\rightarrow$  GeV  $\gamma$ -ray excess around the GC:

**reasonable chi square** ( $\chi^2/\text{d.o.f.} \sim 1$ )

prediction:  $m_a \sim 0.9 \text{ GeV}$
