

Searching for inflationary gravitational waves with the South Pole Telescope

Christian Reichardt
University of Melbourne

The CMB is polarised (~10%)

Smith et al 2008

- Any polarisation pattern can be decomposed into “E” (grad) and “B” (curl) modes

- Density fluctuations at LSS do not produce “B” modes!

The South Pole Telescope (SPT)

10 m telescope

Sub-millimeter Wavelength Telescope:

- 10 meter telescope (1.1' FWHM beam)
- Off-axis Gregorian optics design
- Fast scanning (up to 2 deg/sec in azimuth)
- 2" pointing accuracy

The South Pole Telescope (SPT)

10 m telescope

SPTpol - 2nd camera on SPT

- 1536 *polarization-sensitive* bolometers
- 500 deg² survey
 - 8 μ K-arcmin @ 95 GHz
 - 5 μ K-arcmin @ 150 GHz

The South Pole Telescope (SPT)

10 m telescope

SPT-3G - 3rd camera on SPT

- 10x more bolometers (16,200)
- 1500 deg² survey in 95, 150, 220 GHz
- Currently in 2nd year of observations

Latest from the Pole

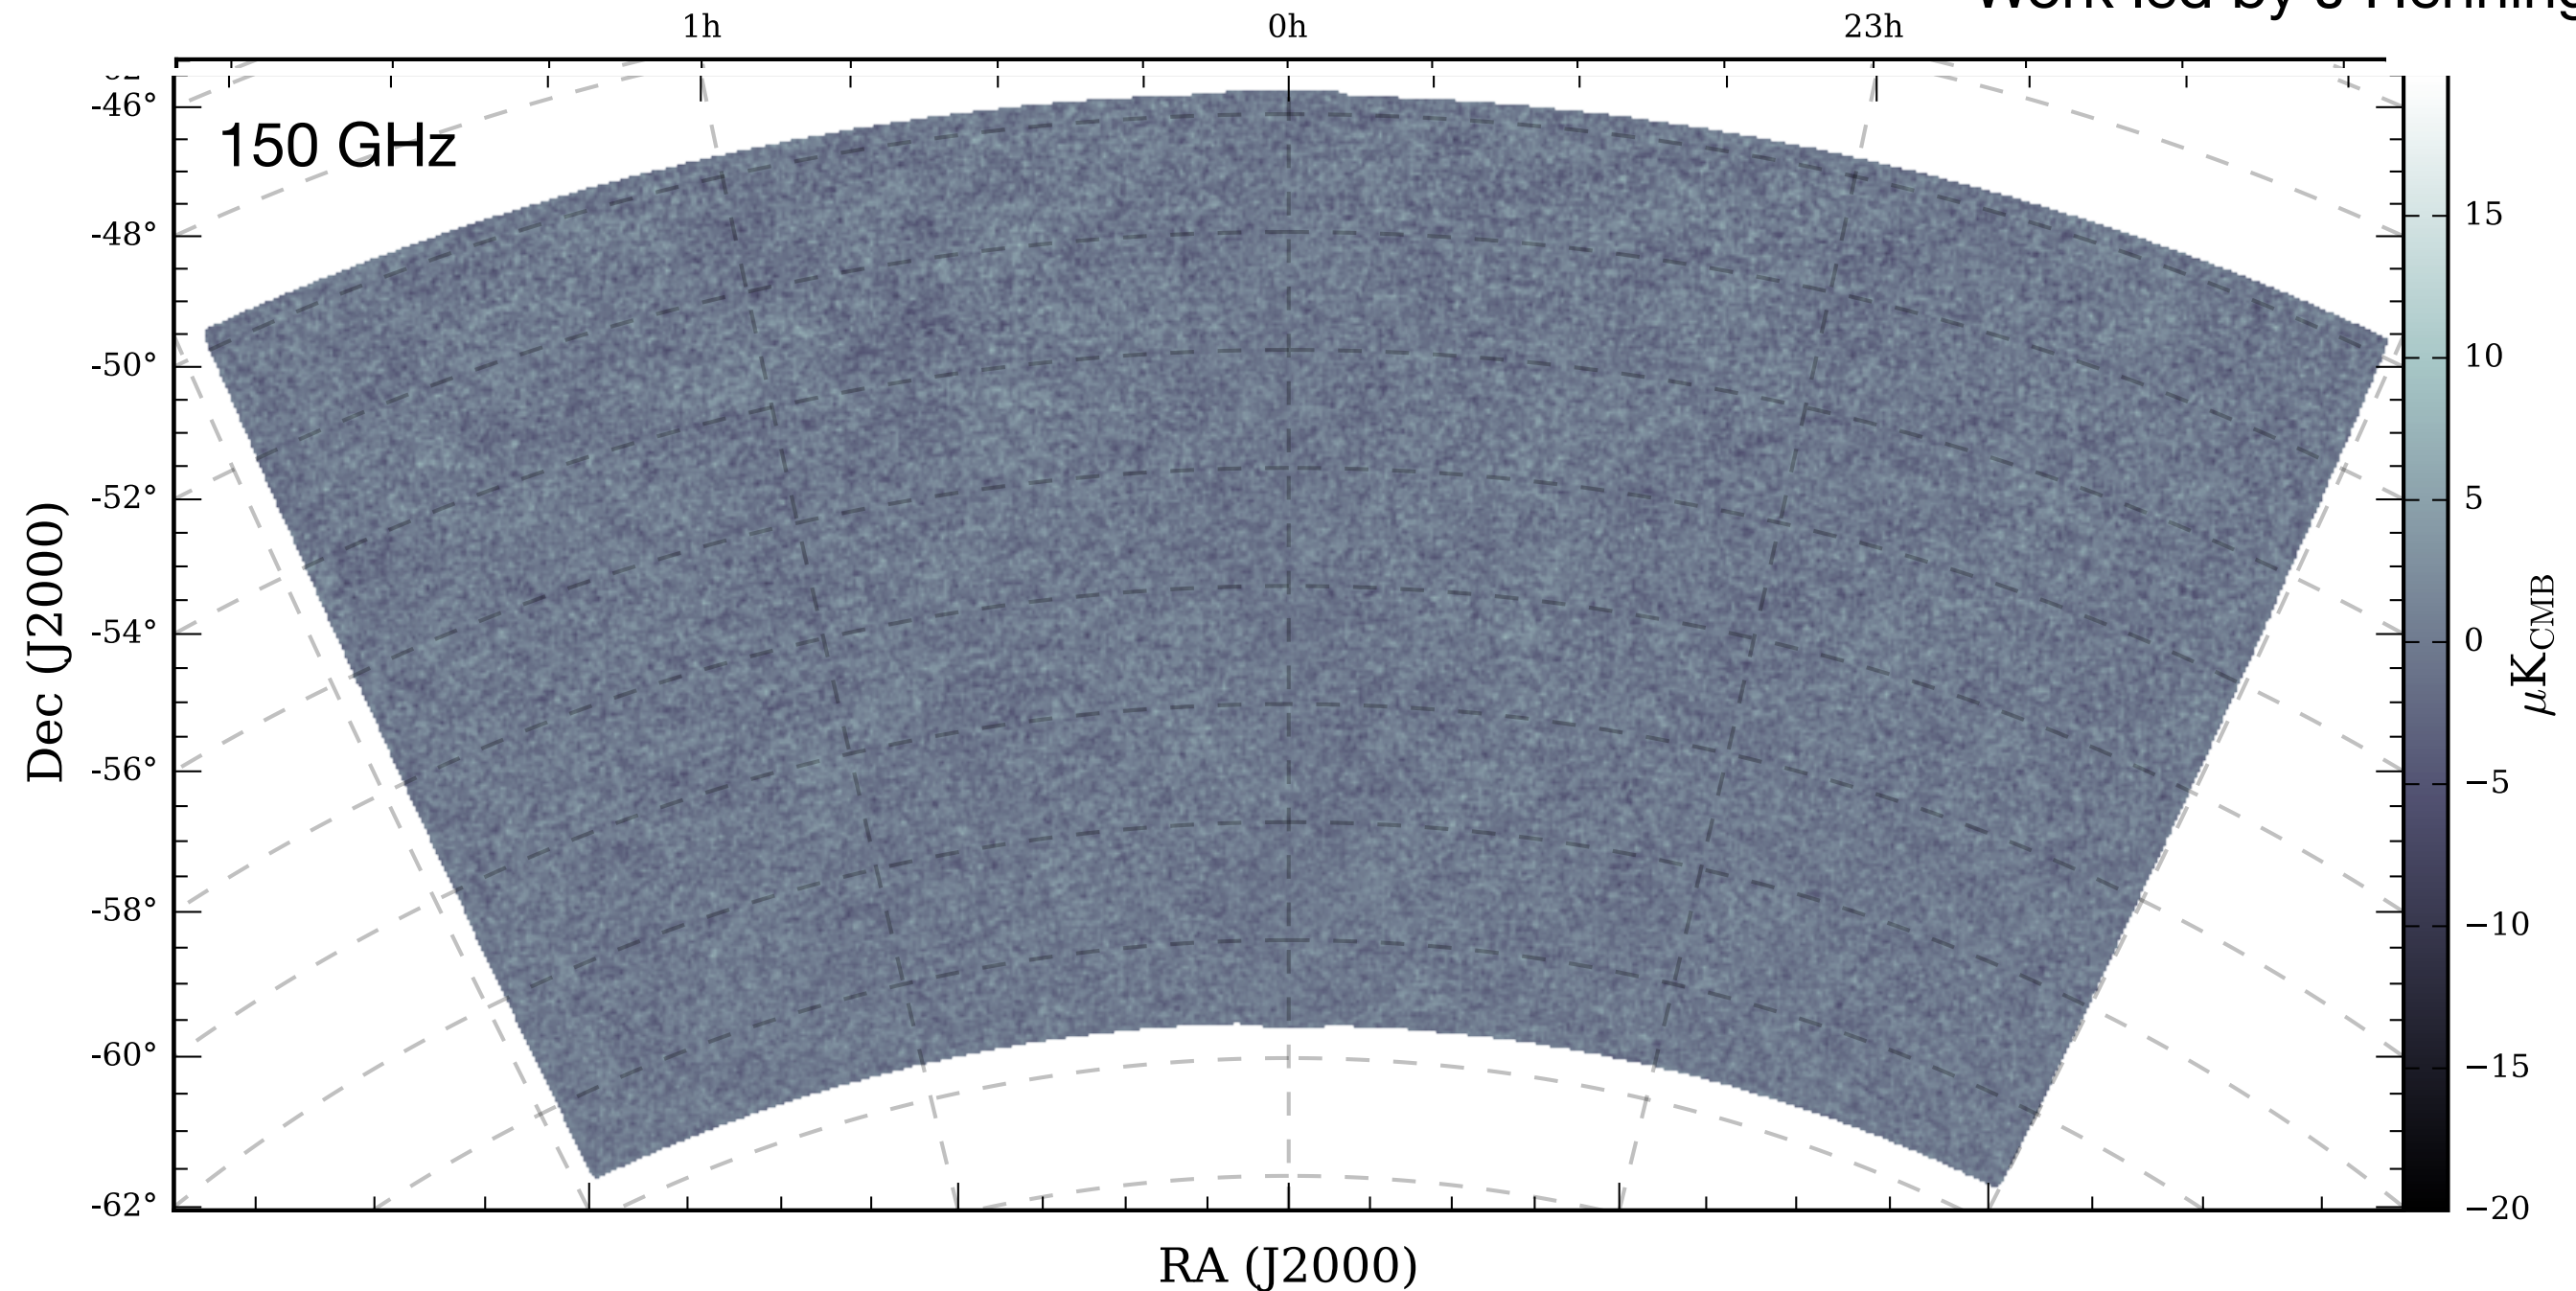

Sunrise

E-modes - A noise map

Work led by J Henning

- Map from the first half of the season minus the second half
- Noise: $9.4 \mu\text{K-arcmin}$ between $1000 < \ell < 3000$.

E-modes measured with SPTpol

Work led by J Henning

- High signal-to-noise!

E-mode power spectra

Best measurements at $\ell > 1050$!

But what about B?

(with an focus on r)

- Direct measurements
- Delensing for inflation

B-modes measured with SPTpol

Work led by JT Sayre

Note: not same color range

- Signal-to-noise < 1 per mode
(but lots of modes)

*Also have
95 GHz maps*

**New SPTpol
B-mode power spectrum
coming soon!**

SPT-3G

Delensing

Last COSMO: Alessandro showed delensing of 24% on the SPTpol 100d field (Manzotti et al. ApJ 2017)

SPT-3G will remove 2/3s of lensing BB power

New era: delensing crucial to IGW searches

SPT-3G will remove 2/3s of lensing BB power

In conclusion

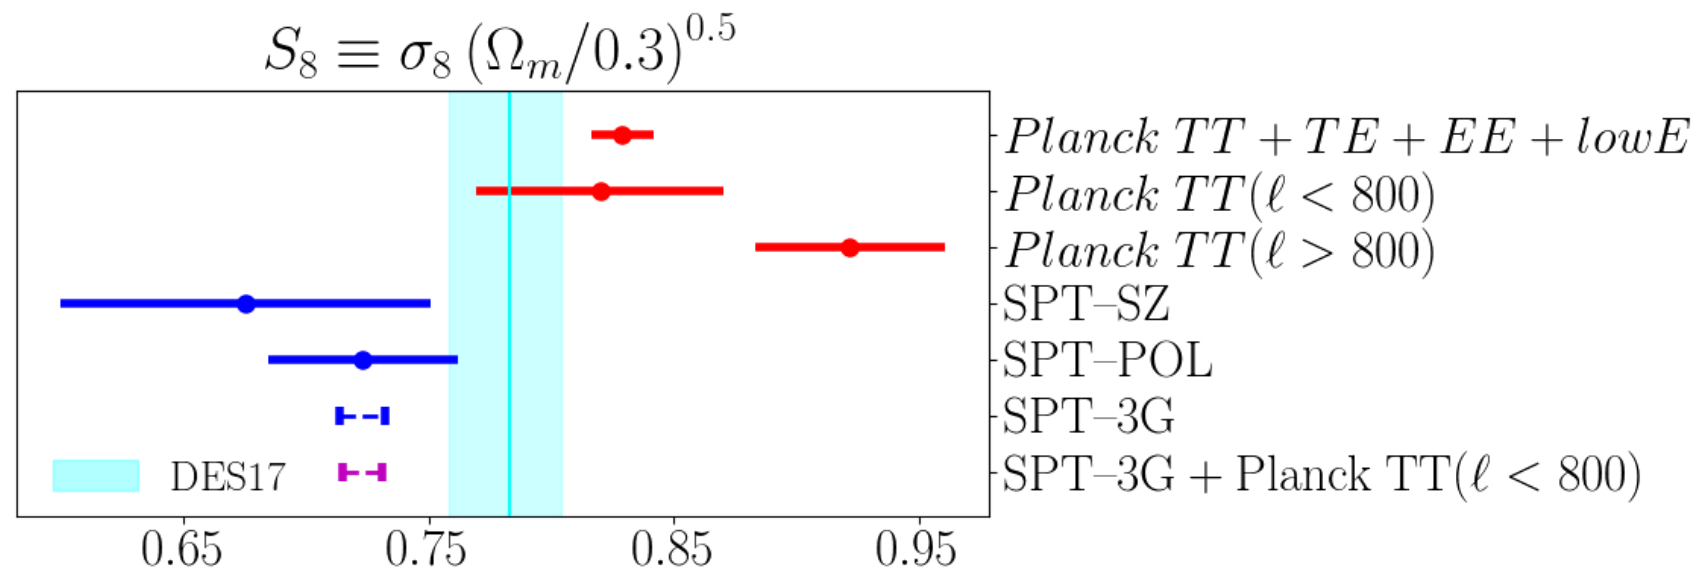

- SPTpol has made the best measurements of the E-mode damping tail
 - New B-mode spectra from SPTpol coming soon!
- SPT3G is on sky with x10 more detectors
 - significant upgrade in sensitivity!
