

# An Analytic Approach to Light Dark Matter Propagation

*Tuesday, 13 June 2023 14:20 (20 minutes)*

Although searches for GeV-scale WIMPs are sensitive to very small cross sections, constraints on sub-GeV dark matter are significantly weaker, and largely constrain moderately- or strongly-interacting dark matter. But if dark matter interacts too strongly with nuclei, it could be slowed to undetectable speeds in Earth's crust or atmosphere before reaching a detector. For sub-GeV dark matter, approximations used to model the attenuation of heavier dark matter fail, necessitating the use of computationally expensive simulations. I present a new, analytic approximation for modeling attenuation of light dark matter in the Earth. I show that our approach agrees well with Monte Carlo results, and can be much faster at large cross sections.

## Secondary category for the parallel session (optional)

Astroparticle Physics

**Primary author:** CAPPIELLO, Christopher (Queen's University)

**Presenter:** CAPPIELLO, Christopher (Queen's University)

**Session Classification:** Parallel: Dark Matter 3

**Track Classification:** Parallel Sessions: Dark Matter Physics
