

# Connectivity systems, path-width, and well-quasi-ordering

*Wednesday, 21 August 2024 12:05 (25 minutes)*

We prove that, for any integer  $k$ , there are only finitely many excluded minors for the class of matroids of path-width  $k$ . This result is obtained as a consequence of a well-quasi-ordering result on connectivity systems of bounded path-width. This is joint work with Rutger Campbell.
