The Higgs is intriguing

- the only elementary scalar in the spectrum of the SM
- introduces the hierarchy problem
- no three-fold replication, unlike the rest of the matter

In **SUSY** the presence of the Higgs(es) is more natural:

- scalar particles exist by construction
- the hierarchy problem can be solved
- models predict the Higgs mass ≤ 140 GeV

BUT

- NO explanation is given for the existence of only one family
- Their behaviour is very different from the rest of the matter

Supersymmetry

Higgses do not have a three-fold replication as the rest of the matter.

$$L_i = \begin{pmatrix} \nu_i \\ e_i \end{pmatrix}, \qquad e_i^c \\ - \qquad Q_i = \begin{pmatrix} u_i \\ d_i \end{pmatrix}, \quad d_i^c \qquad \text{3 families of superfields in SUSY}$$
 sleptons + leptons squarks + quarks

$$H_d = \begin{pmatrix} H_d^0 \\ H_d^- \end{pmatrix}, \ H_u = \begin{pmatrix} H_u^+ \\ H_u^0 \end{pmatrix}, \ H_u = \begin{pmatrix} H_u^+ \\ H_u^0 \end{pmatrix}, \ \mathbf{W} = \ \mathbf{Y_e} \ \mathbf{H_d}^\mathsf{T} \ \boldsymbol{\epsilon} \ \mathbf{L} \ \mathbf{e^c} \ + \ \mathbf{Y_d} \ \mathbf{H_d}^\mathsf{T} \ \boldsymbol{\epsilon} \ \mathbf{Q} \ \mathbf{d^c} \ - \ \mathbf{Y_u} \ \mathbf{H_u}^\mathsf{T} \boldsymbol{\epsilon} \ \mathbf{Q} \ \mathbf{u^c}$$

but since H_d and L have the same SM quantum numbers, Y = -1/2

this might lead one to interpret the Higgs superfield $L_4=\begin{pmatrix} \nu_4 \\ e_4 \end{pmatrix}=\begin{pmatrix} H_d^0 \\ H_d^- \end{pmatrix}=H_d$ as a fourth family of lepton superfields

Unfortunately, one cannot interpret naturally the superfield H_u in a similar way, given that it is a doublet with no leptonic counterpart for its neutral component (...right-handed neutrinos)

$$L_4 = \begin{pmatrix} \nu_4 \\ e_4 \end{pmatrix} = \begin{pmatrix} H_d^0 \\ H_d^- \end{pmatrix} = H_d$$

- Actually, even H_d cannot be interpreted as a fourth family of leptons, since
 - there can be no mixing between particles and sparticles,

Higgses are NOT sleptons and Higgsinos are NOT leptons

thus their behaviour is very different, e.g.:

$$\neq 0$$
, $\neq 0$, $<\Psi_{uL}> = 0$, $<\mathfrak{V}_{\mu L}> = 0$, $<\mathfrak{V}_{\tau L}> = 0$

This connection is ONLY posible if R-parity is violated

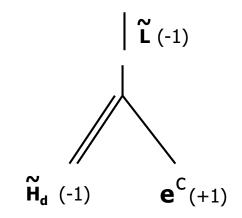

e.g. the Yukawa couplings of the MSSM

$$W = Y_{ij}^{e} H_d L_i e_j^c + Y_{ij}^{d} H_d Q_i d_j^c - Y_{ij}^{u} H_u Q_i u_j^c$$

have effectively a Z₂ discrete symmetry (**R parity**)

$$R_p$$
 (particle) = +1
 R_p (sparticle) = -1

i.e. sparticles must appear in pairs

because of these couplings, there are mixing between sparticles, e.g. gauginos & higgsinos

$$\mathbf{\tilde{H_{u}^{0}}} \leftarrow \mathbf{\tilde{H}_{u}^{0}} \ (-1) \qquad (\tilde{B}^{0}, \tilde{W}^{0}, \tilde{H}_{1}^{0}, \tilde{H}_{2}^{0}) \qquad \qquad \mathcal{M} = \begin{pmatrix} M_{1} & 0 & -\frac{g'\nu_{1}}{\sqrt{2}} & \frac{g'\nu_{2}}{\sqrt{2}} \\ 0 & M_{2} & \frac{g\nu_{1}}{\sqrt{2}} & -\frac{g\nu_{2}}{\sqrt{2}} \\ -\frac{g'\nu_{1}}{\sqrt{2}} & \frac{g\nu_{1}}{\sqrt{2}} & 0 & -\mu \\ \frac{g'\nu_{2}}{\sqrt{2}} & -\frac{g\nu_{2}}{\sqrt{2}} & -\mu & 0 \end{pmatrix}$$

$$\mathbf{4} \ \text{neutralinos:} \qquad \tilde{\chi}_{1}^{0} = N_{11}\tilde{B}^{0} + N_{12}\tilde{W}^{0} + N_{13}\tilde{H}_{1}^{0} + N_{14}\tilde{H}_{2}^{0} \\ \mathbf{2} \ \text{charginos:} \qquad (\tilde{W}^{+}, \tilde{H}^{+})$$

BUT because of the different R_p quantum numbers, there can be no mixing between particles and sparticles, e.g. between neutralinos and neutrinos, ...

Supersymmetry with right-handed neutrinos

The gauge-invariant trilinear superpotential containing right-handed neutrinos:

Lopez-Fogliani, C. M., PRL 2006

$$W = Y_{ij}^{e} H_{d} L_{i} e_{j}^{c} + Y_{ij}^{d} H_{d} Q_{i} d_{j}^{c} - Y_{ij}^{u} H_{u} Q_{i} u_{j}^{c} - Y_{ij}^{\nu} H_{u} L_{i} \nu_{j}^{c}$$

$$+ \lambda_{ijk} L_{i} L_{j} e_{k}^{c} + \lambda'_{ijk} L_{i} Q_{j} d_{k}^{c} + \frac{1}{3} \kappa_{ijk} \nu_{i}^{c} \nu_{j}^{c} \nu_{k}^{c} + \lambda_{i} H_{u} H_{d} \nu_{i}^{c}.$$

$$v_{iR}(+1) \qquad H_{d} (-1)$$

$$<\!\!H_u^{~0}\!\!>$$
 , $<\!\!H_d^{~0}\!\!>$, $<\!\!\widetilde{\nu}_{iL}\!\!>$, $<\!\!\widetilde{\nu}_{iR}\!\!>$ \neq 0

Fields with the same color, electric charge and spin naturally mix, e.g.:

"Neutrinos"

$$(\tilde{B^0}, \tilde{W^0}, \tilde{H_d}, \tilde{H_u}, \nu_{R_i}, \nu_{L_i}),$$

Parameter which determines the violation of R_p : Y^v

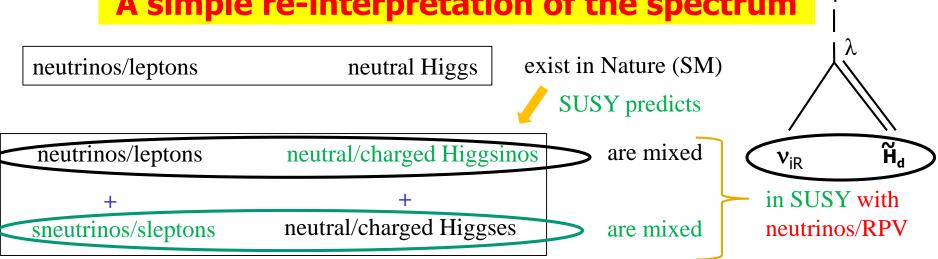

Y' \longrightarrow 0 the v^c are no longer neutrinos, they are just ordinary singlets like the N of the NMSSM: N H₁ H₂ + NNN, and R-parity is conserved

 ν_{R}

 $H_{..}(+1)$

<H., >

A simple re-interpretation of the spectrum

There are only neutrinos/leptons (and quarks) and their scalar partners

$$L_{i} = \begin{pmatrix} \nu_{i} \\ e_{i} \end{pmatrix}, \qquad e_{i}^{c}, \quad Q_{i} = \begin{pmatrix} u_{i} \\ d_{i} \end{pmatrix}, \quad d_{i}^{c} \\ u_{i}^{c} \end{pmatrix}, \qquad L_{i} = \begin{pmatrix} \nu_{i} \\ e_{i} \end{pmatrix}, \qquad e_{i}^{c}, \quad Q_{i} = \begin{pmatrix} u_{i} \\ d_{i} \end{pmatrix}, \quad d_{i}^{c} \\ u_{i}^{c} \end{pmatrix}$$

$$H_{d} = \begin{pmatrix} H_{d}^{0} \\ H_{d}^{-} \end{pmatrix}, \quad H_{u} = \begin{pmatrix} H_{u}^{+} \\ H_{u}^{0} \end{pmatrix} \quad \text{Higgses are vector-like} \quad \text{leptons of a fourth family}$$

$$L_{4} = \begin{pmatrix} \nu_{4} \\ e_{4} \end{pmatrix}, \quad L_{4}^{c} = \begin{pmatrix} e_{4}^{c} \\ \nu_{4}^{c} \end{pmatrix}.$$

In this framework, the first scalar particle discovered at the LHC is a sneutrino belonging to a 4th-family vector-like doublet representation

H.,

Extra bonuses

$$W = Y_{ij}^{e} H_{d} L_{i} e_{j}^{c} + Y_{ij}^{d} H_{d} Q_{i} d_{j}^{c} - Y_{ij}^{u} H_{u} Q_{i} u_{j}^{c} - Y_{ij}^{\nu} H_{u} L_{i} \nu_{j}^{c}$$

$$+ \lambda_{ijk} L_{i} L_{j} e_{k}^{c} + \lambda'_{ijk} L_{i} Q_{j} d_{k}^{c} + \frac{1}{3} \kappa_{ijk} \nu_{i}^{c} \nu_{j}^{c} \nu_{k}^{c} + \lambda_{i} H_{u} H_{d} \nu_{i}^{c}.$$

When the right sneutrinos acquire VEVs of order the EW scale, an effective μ -term from ν is generated ($\mu\nu$ SSM)

Lopez-Fogliani, C. M., PRL 2006

-producing higgsino masses beyond the experimental bounds $\mu \geq 100$ GeV

solving the μ problem: What is the origin of $\mu,$ and why is so small $<< M_{Planck}$

-as well as effective Majorana masses for neutrinos: EW scale seesaw

$$m_v \sim m_D^2/M_M = (Y_v v_u)^2/(\kappa v_R) \sim (10^{-6} 10^2)^2/10^3 = 10^{-11} \text{ GeV} = 10^{-2} \text{ eV}$$

Like the electron Yukawa

solving the v problem: How to accommodate the neutrino data

Extra bonuses

- Since R parity is violated, SUSY particles can decay to standard model particles, there is no missing energy as a special signal, and the bounds become significantly weaker
- Interesting LHC phenomenology because of R-parity violation
 - Novel signals with displaced vertices, multilepton final states, multijets

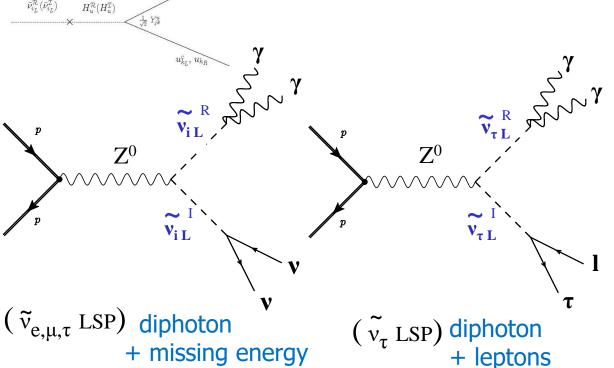

...

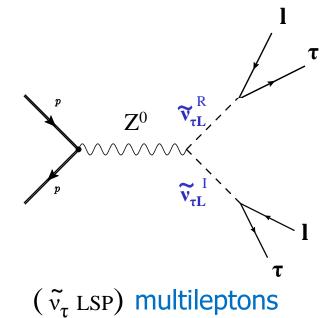

E.g.:

Left Sneutrino LSP

 $\mathbf{v_{i L}}$ $i=e,\mu,\tau$

Ghosh, Lara, Lopez-Fogliani, C.M., Ruiz de Austri, arXiv:1707.02471

$$Y_{\rm V} \sim 10^{-6}$$

 $45 \leq m_{\tilde{v}_r} \leq 300 \,\text{GeV}$

in order to observe its production at the LHC

 $m_{\widetilde{v}_r} \sim 45 - 100 \, GeV$ have decay lengths $\sim mm$

Proposal for new quarks

$$L_i = \begin{pmatrix} \nu_i \\ e_i \end{pmatrix}, \qquad e_i^c \\ \nu_i^c \end{pmatrix}, \qquad Q_i = \begin{pmatrix} u_i \\ d_i \end{pmatrix}, \qquad d_i^c \\ u_i^c \end{pmatrix}, \qquad \text{For the first 3 families,} \\ \text{each lepton representation has its quark counterpart}$$

$$L_4 = \begin{pmatrix} \nu_4 \\ e_4 \end{pmatrix}, \ L_4^c = \begin{pmatrix} e_4^c \\ \nu_4^c \end{pmatrix}, \qquad Q_4 = \begin{pmatrix} u_4 \\ d_4 \end{pmatrix}, \ Q_4^c = \begin{pmatrix} d_4^c \\ d_4 \end{pmatrix}, \qquad Y_{=-1/6}$$

In analogy, we add to the 4th family a vector-like quark doublet representation as counterpart of the vector-like lepton/Higgs doublet representation

$$W = Y_{ij}^{e} H_{d} L_{i} e_{j}^{c} + Y_{ij}^{d} H_{d} Q_{i} d_{j}^{c} - Y_{ij}^{u} H_{u} Q_{i} u_{j}^{c} - Y_{ij}^{\nu} H_{u} L_{i} \nu_{j}^{c}$$

$$+ \lambda_{ijk} L_{i} L_{j} e_{k}^{c} + \lambda'_{ijk} L_{i} Q_{j} d_{k}^{c} + \frac{1}{3} \kappa_{ijk} \nu_{i}^{c} \nu_{j}^{c} \nu_{k}^{c} + \lambda_{i} H_{u} H_{d} \nu_{i}^{c}$$

$$+ \lambda'_{i4k} L_{i} Q_{4} d_{k}^{c} + Y_{4k}^{d} H_{d} Q_{4} d_{k}^{c} - Y_{4k}^{u} H_{u} Q_{4} u_{k}^{c} + Y_{j4k}^{Q} Q_{j} Q_{4}^{c} \nu_{k}^{c} + Y_{44k}^{Q} Q_{4} Q_{4}^{c} \nu_{k}^{c}$$

$$+ \lambda'_{i4k} L_{i} Q_{4} d_{k}^{c} + Y_{4k}^{d} H_{d} Q_{4} d_{k}^{c} - Y_{4k}^{u} H_{u} Q_{4} u_{k}^{c} + Y_{j4k}^{Q} Q_{j} Q_{4}^{c} \nu_{k}^{c} + Y_{44k}^{Q} Q_{4} Q_{4}^{c} \nu_{k}^{c}$$

$$+ \lambda'_{i4k} L_{i} Q_{4} d_{k}^{c} + Y_{4k}^{d} H_{d} Q_{4} d_{k}^{c} - Y_{4k}^{u} H_{u} Q_{4} u_{k}^{c} + Y_{j4k}^{Q} Q_{j} Q_{4}^{c} \nu_{k}^{c} + Y_{44k}^{Q} Q_{4} Q_{4}^{c} \nu_{k}^{c}$$

We note in passing...

The presence of extra vector-like matter is a common situation in string constructions: Orbifolds, Branes,...

Novel signatures for vector-like quarks

arXiv: 1705.02526, JHEP

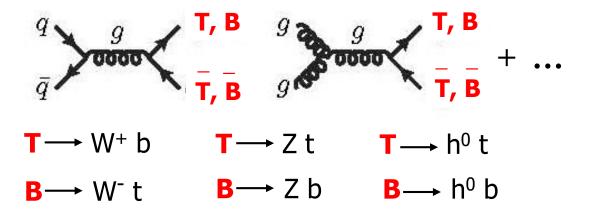

Work in collaboration with

J. A. Aguilar-Saavedra (Univ. Granada, Spain)

D. E. López-Fogliani (CONICET, Univ. Buenos Aires, Argentina)

Detection of heavy vector-like quarks (T B) at the LHC

Many searches for heavy quark pair or single production focus on the standard decay modes:

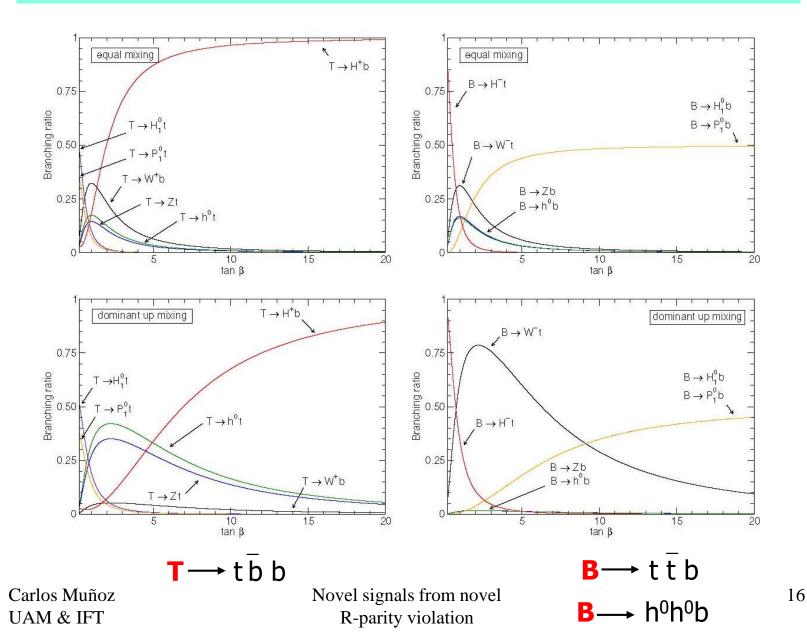

New BRs are possible in models with non-minimal scalar sectors, modifying the analyses:

New signals can be produced:

$$T \longrightarrow t\bar{t}t$$
 $T \longrightarrow h^0 h^0 t$
 $B \longrightarrow t\bar{t}b$ $B \longrightarrow h^0 h^0 b$

Detection of heavy vector-like quarks (T B) at the LHC

The lower limits on the (T,B) quark masses are less stringent

Conclusions

SUSY with right-handed neutrinos naturally produces R-parity violation

- Interesting theoretical advantages:
 - solves the μ problem
 - solves the v problem
 - reinterpretion of the Higgs(es) as a "4th family" of lepton superfields
- Interesting LHC phenomenology:
 - Novel signals with displaced vertices,

multilepton final states, multijets diphoton + leptons diphoton + missing energy

new vector-like quarks:

$$T \longrightarrow t \bar{t} t \quad T \longrightarrow h^0 h^0 t \quad B \longrightarrow t \bar{t} b \quad B \longrightarrow h^0 h^0 b$$
